链表与递归

从Leetcode上一个问题开始

203. 删除链表中的元素

在链表中删除值为val的所有节点

- 如 1->2->6->3->4->5->6->NULL, 要求删除值为6的节点
- 返回 1->2->3->4->5->NULL

实践:解决203,不使用虚拟头结点

实践: 测试leetcode上的链表程序

实践:解决203,使用虚拟头结点

递归与递归的宏观语意

递归

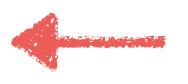

• 本质上,将原来的问题,转化为更小的同一问题

• 举例: 数组求和

Sum(arr[0...n-1]) = arr[0] + Sum(arr[1...n-1]) • 更小的同一问题

Sum(arr[1...n-1]) = arr[1] + Sum(arr[2...n-1]) • 更小的同一问题

Sum(arr[n-1...n-1]) = arr[n-1] + Sum([])

最基本的问题

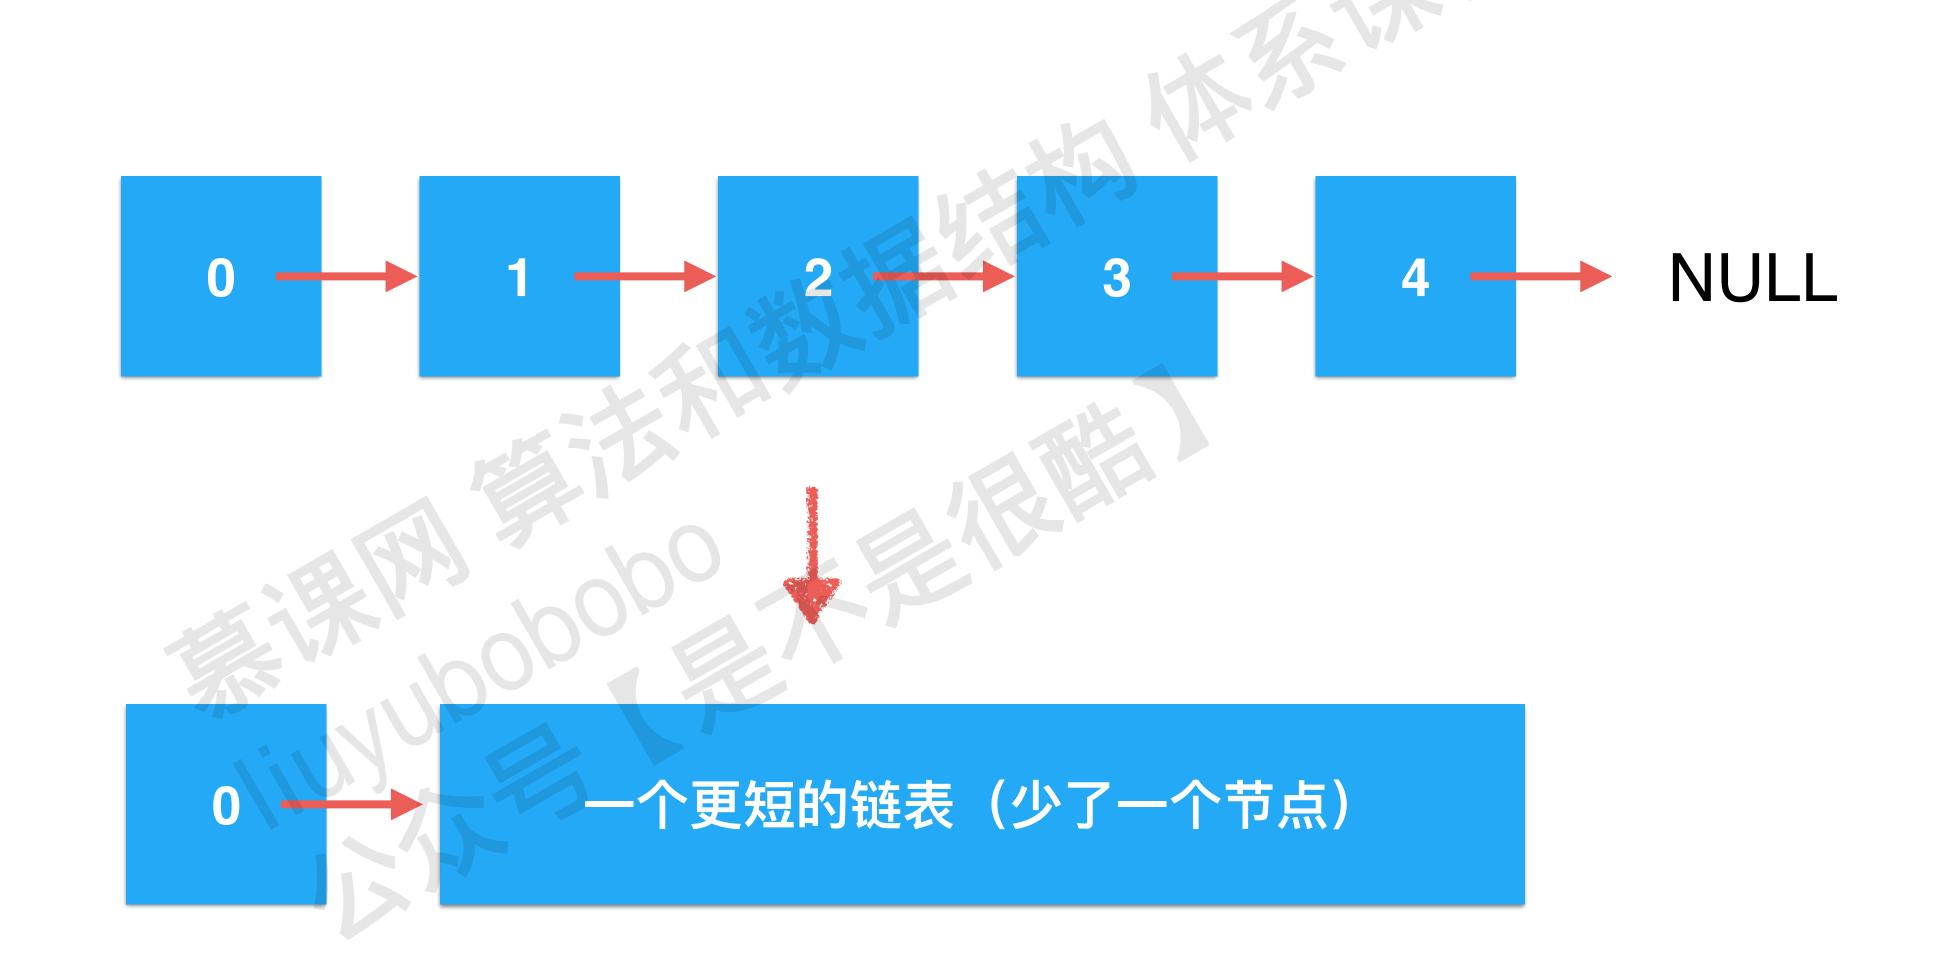

递归

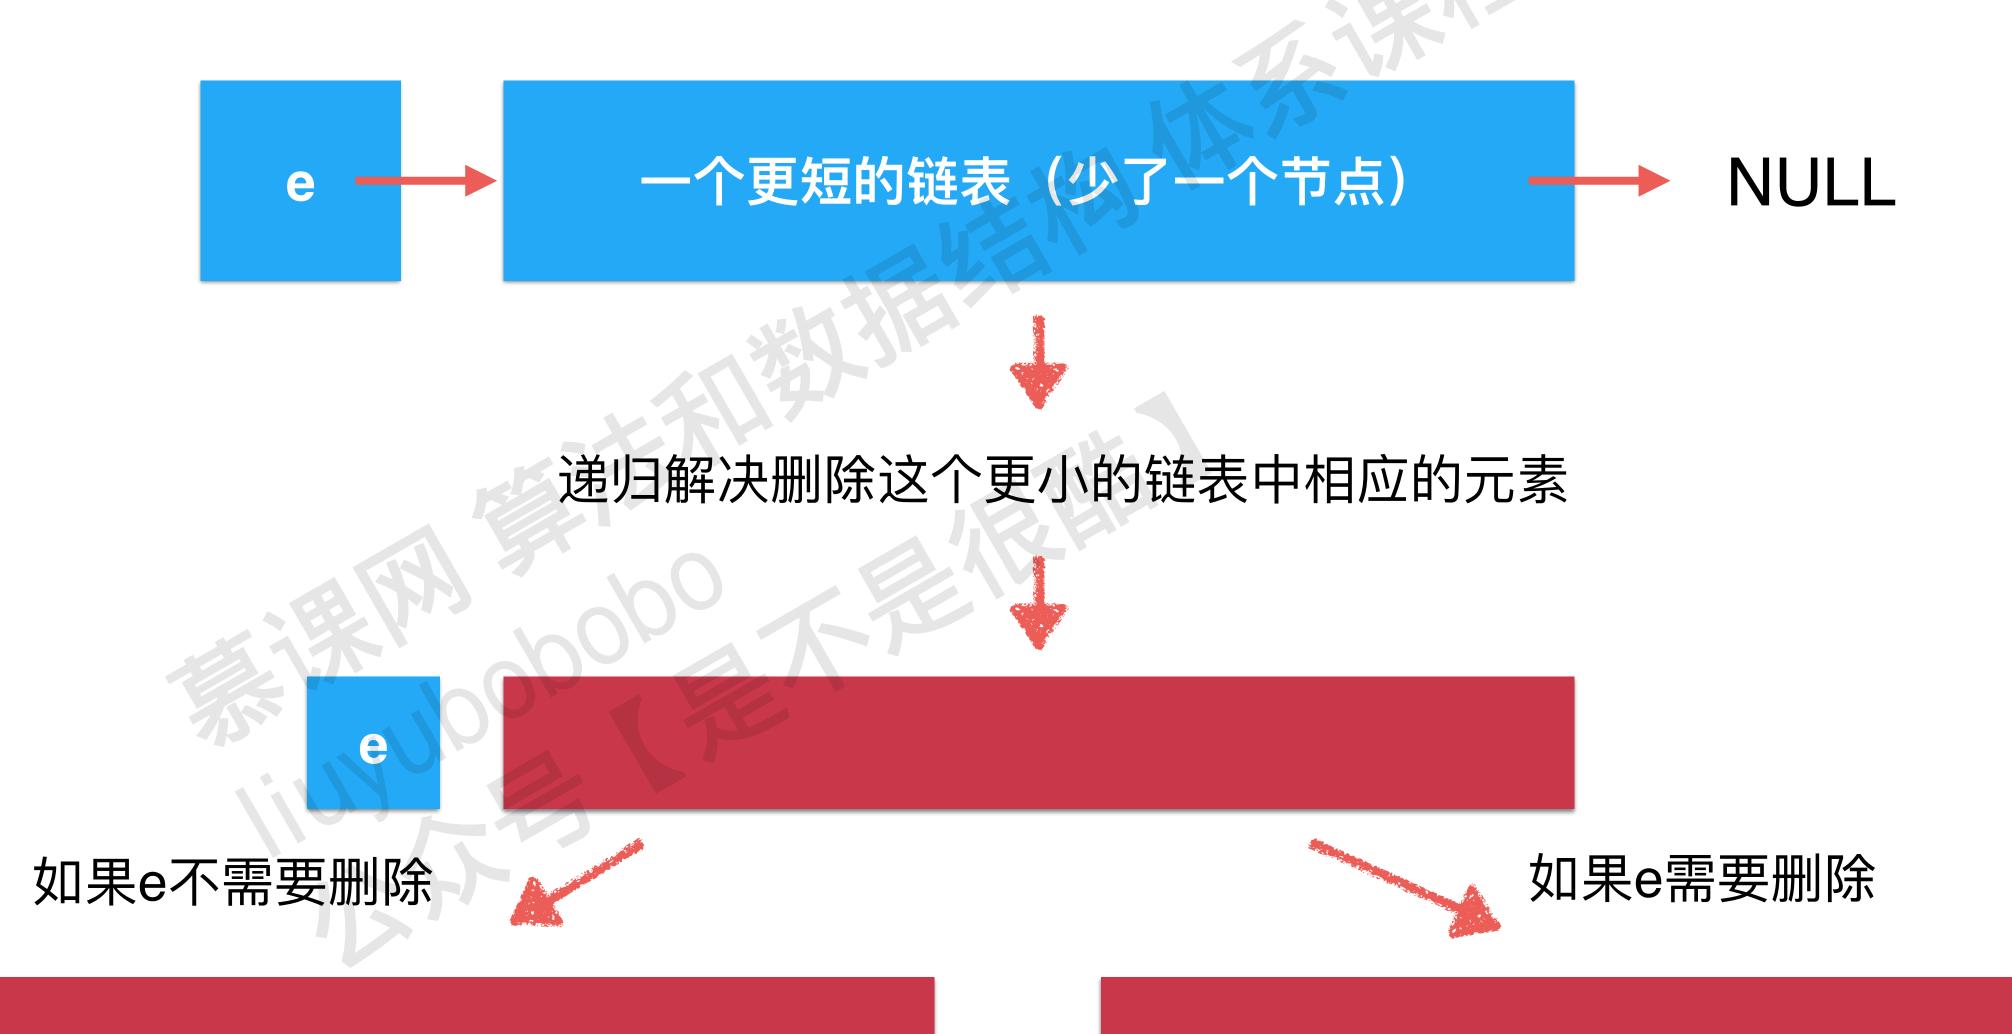

- 注意递归函数的"宏观"语意
- 递归函数就是一个函数,完成一个功能

链表和递归

链表天然的递归性

解决链表中删除元素的问题

实践: Leetcode 203 使用递归思路求解

栈的应用

• 程序调用的系统栈

栈顶

B2

A2

```
public static int sum(int[] arr, int l){
   if(l == arr.length)
      return 0;

return arr[l] + sum(arr, l + 1);
}
```

- 递归函数的调用,本质就是函数调用
- 只不过调用的函数是自己而已

```
public static int sum(int[] arr, int l){
   if(l == arr.length)
      return 0;

   int x = sum(arr, l + 1);
   int res = arr[l] + x;
   return res;
}
```

```
arr = [6, 10]

int sum(int[] arr, int l){

if(l == n) return 0;
   int x = sum(arr, l + 1);
   int res = arr[l] + x;
   return res;
}
```

```
arr = [6, 10]

调用sum(arr, 0)

int sum(int[] arr, int l){
    if(l == n) return 0;
    int x = sum(arr, l + 1);
    int res = arr[l] + x;
    return res;
}
```

```
arr = [6, 10]

调用sum(arr, 0)

int sum(int[] arr, int l){

    if(l == n) return 0;
    int x = sum(arr, l + 1);
    int res = arr[l] + x;
    return res;
}

int sum(int[] arr, int l){

    if(l == n) return 0;
    int x = sum(arr, l + 1);
    int res = arr[l] + x;
    return res;
}
```

```
arr = [6, 10]

调用sum(arr, 0)

int sum(int[] arr, int l){

    if(l == n) return 0;
    int x = sum(arr, l + 1);
    int res = arr[l] + x;
    return res;
}
```

```

    return res;
                                  return res;
                                                                return res;
   res = 16
                               res = 10
```

```
public ListNode removeElements(ListNode head, int val) {

1    if(head == null)
       return null;

2    head.next = removeElements(head.next, val);
3    return head.val == val ? head.next : head;
}
```

模拟调用,对 6->7->8->null 删除7

```
public ListNode removeElements(ListNode head, int val) {

1    if(head == null)
        return null;

2    head.next = removeElements(head.next, val);
3    return head.val == val ? head.next : head;
}
```

```
public ListNode removeElements(ListNode head, int val) {

1    if(head == null)
       return null;

2    head.next = removeElements(head.next, val);
3    return head.val == val ? head.next : head;
}
```

模拟调用,对 6->7->8->null 删除7

```
public ListNode removeElements(ListNode head, int val) {

1    if(head == null)
       return null;

2    head.next = removeElements(head.next, val);
3    return head.val == val ? head.next : head;
}
```

模拟调用,对 6->7->8->null 删除7

```
public ListNode removeElements(ListNode head, int val) {

1    if(head == null)
       return null;

2    head.next = removeElements(head.next, val);
3    return head.val == val ? head.next : head;
}
```

模拟调用,对 6->7->8->null 删除7

栈的应用

• 程序调用的系统栈

栈顶

B2

A2

栈的应用

- 程序调用的系统栈
- 递归调用是有代价的: 函数调用 + 系统栈空间

```
func A(){
1 ... 1 ... 1 ... 2 ... 3 ... 3 ... }

func A(){
func A(){
1 ... 1 ... 2 ... 3 ... 3 ... 3 ... }
```

栈顶

调试递归程序

实践:调试递归程序

作业:链表的递归实现

- 关于递归
- 近乎和链表相关的所有操作,都可以使用递归的形式完成
- 建议同学们对链表的增,删,改,查,进行递归实现

作业解析:链表的递归实现

递归函数的"宏观"语意:

在以 head 为头节点的链表中删除值为 val 的节点,并返回结果链表的头结点

```
public ListNode removeElements(ListNode head, int val) {
    if(head == null)
        return null;

    head.next = removeElements(head.next, val);
    return head.val == val ? head.next : head;
}
```

```
在以 head 为头节点的链表中删除值为 val 的节点,并返回结果链表的头结点
public ListNode removeElements(ListNode head, int val) {
    if(head == null)
       return null;
   head.next = removeElements(head.next, val);
    return head.val == val ? head.next : head;
                                    更短的链表 (少了一个节点)
可不可以不返回头节点?
```

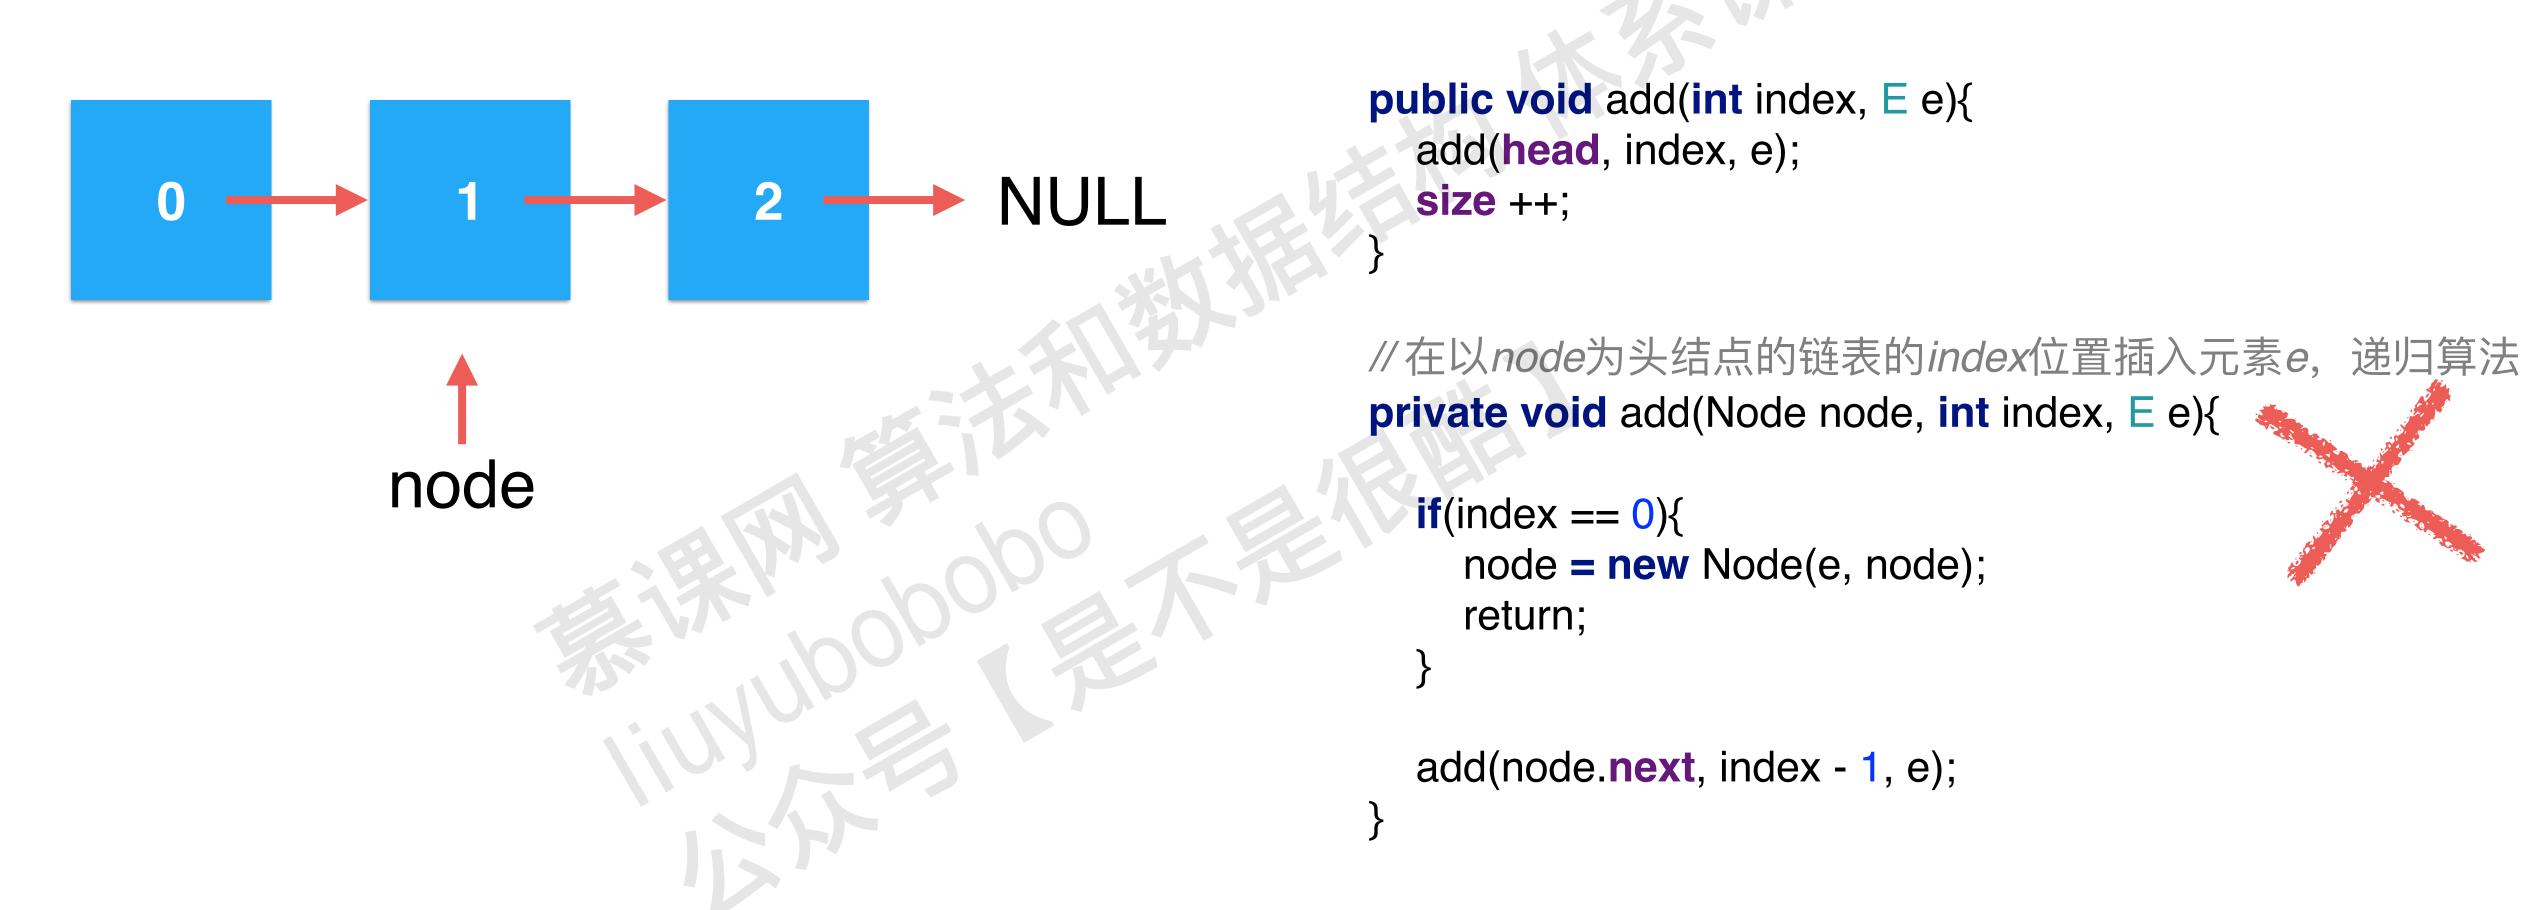

不可以,否则递归函数的结果不能和前面的链表连接起来

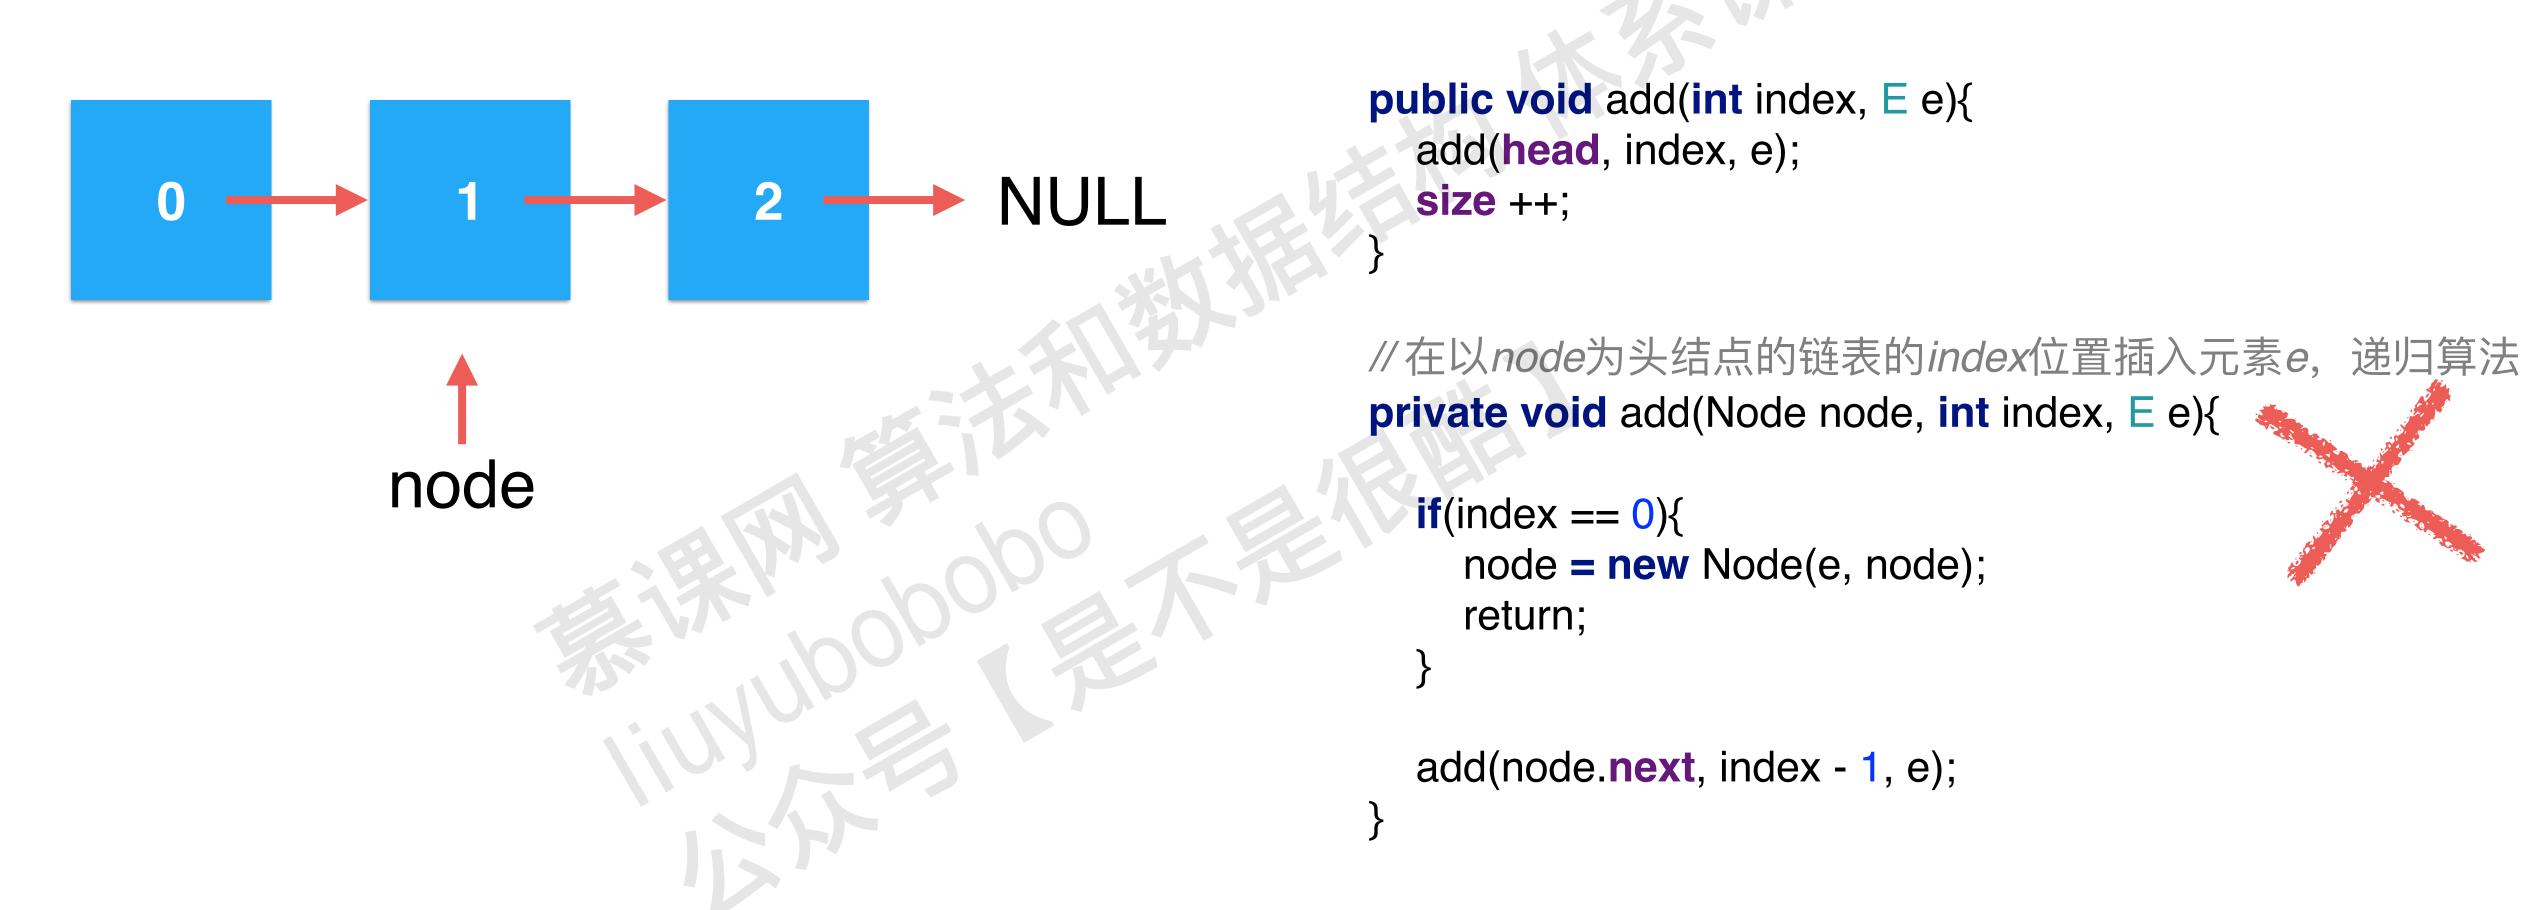

```
public void add(int index, E e){
  head = add(head, index, e);
  size ++;
//在以node为头结点的链表的index位置插入元素e,递归算法
private Node add(Node node, int index, E e){
  if(index == 0)
    return new Node(e, node);
  node.next = add(node.next, index - 1, e);
  return node;
```

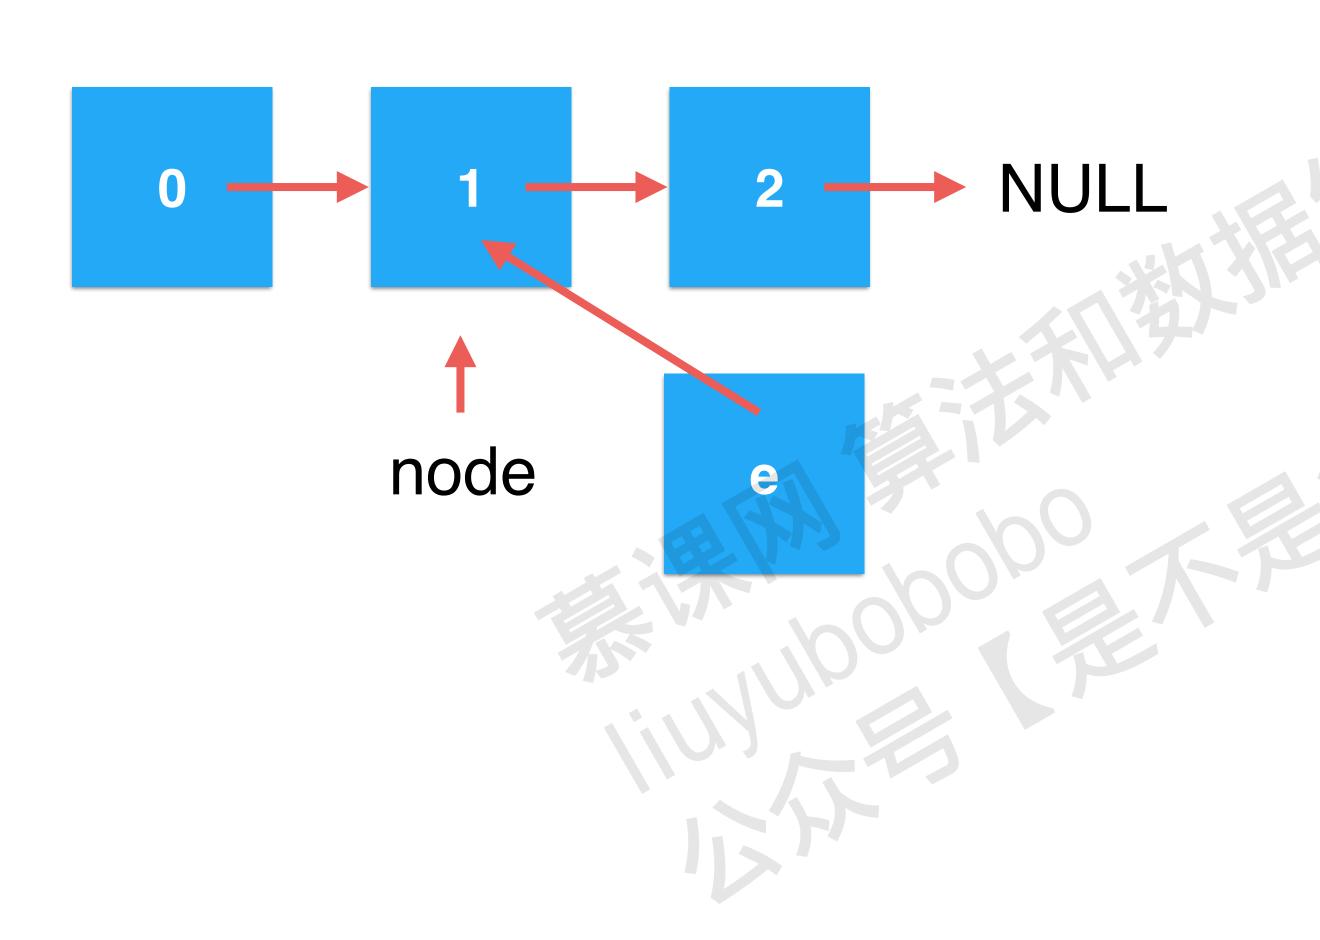

```
public void add(int index, E e){
  add(head, index, e);
  size ++;
//在以node为头结点的链表的index位置插入元素e,递归算法
private void add(Node node, int index, E e){
  if(index == 0){
    node = new Node(e, node);
    return;
  add(node.next, index - 1, e);
```

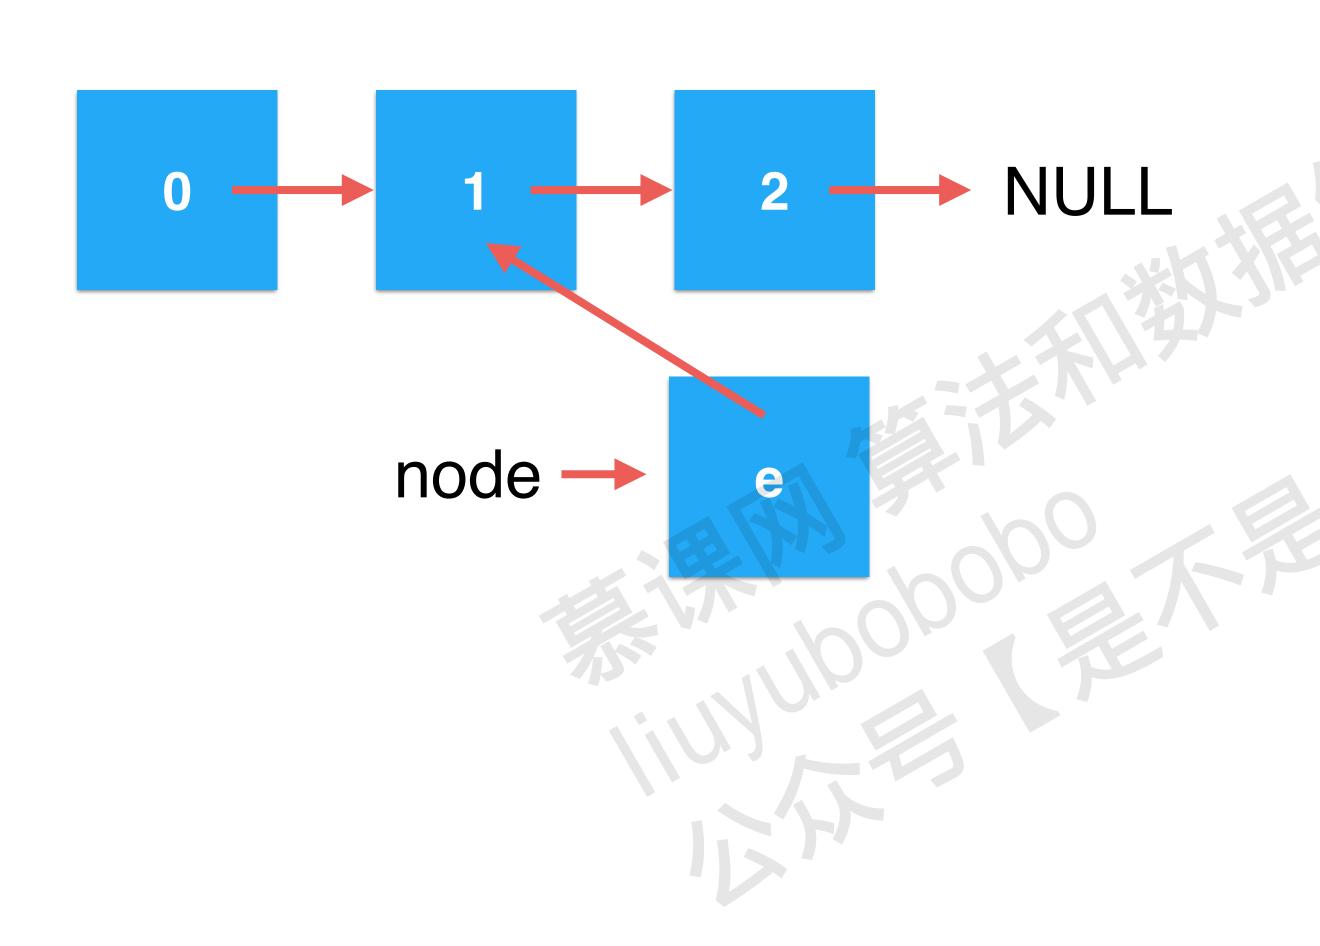

```
public void add(int index, E e){
  add(head, index, e);
//在以node为头结点的链表的index位置插入元素e,递归算法
private void add(Node node, int index, E e){
  if(index == 0){
    node = new Node(e, node);
  add(node.next, index - 1, e);
```

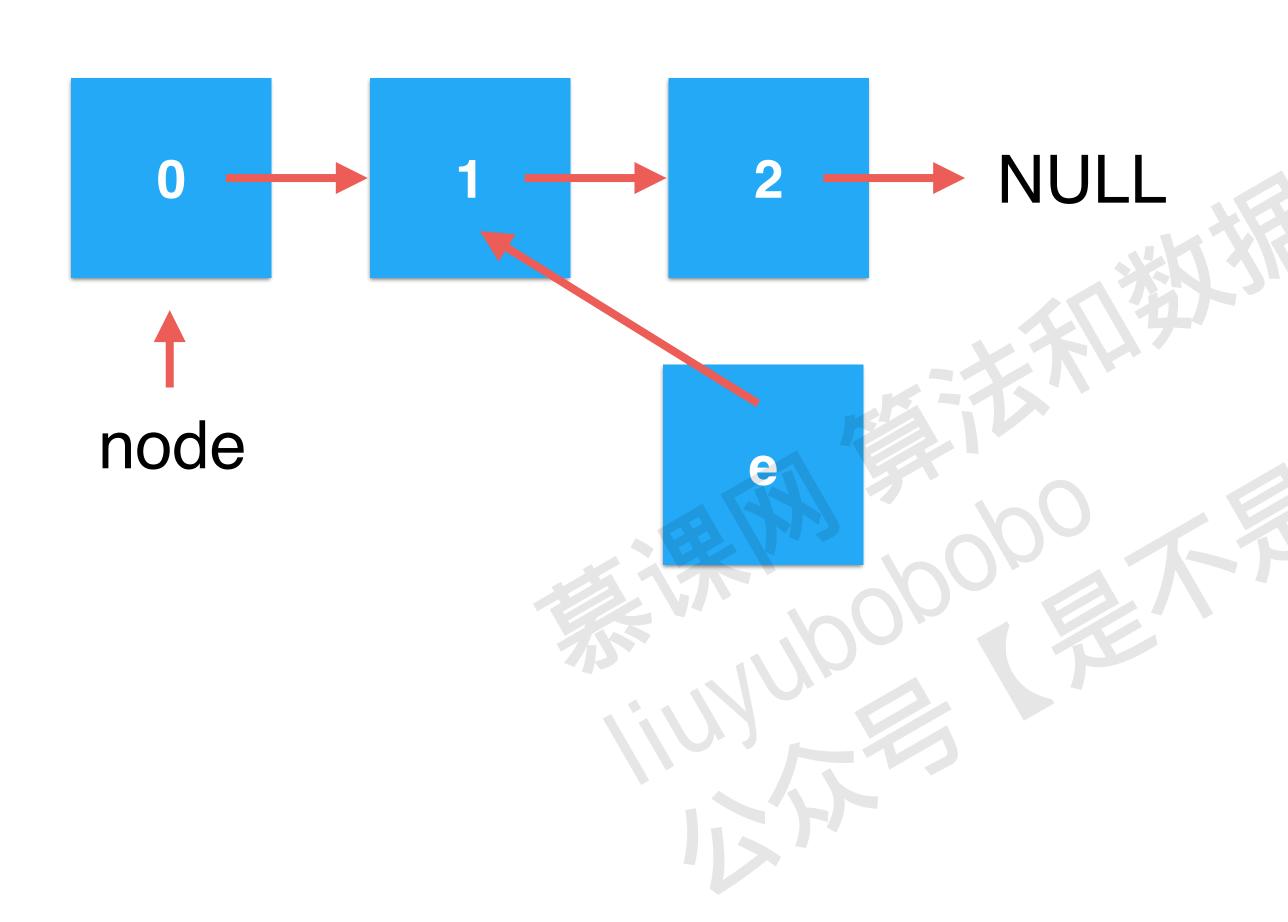

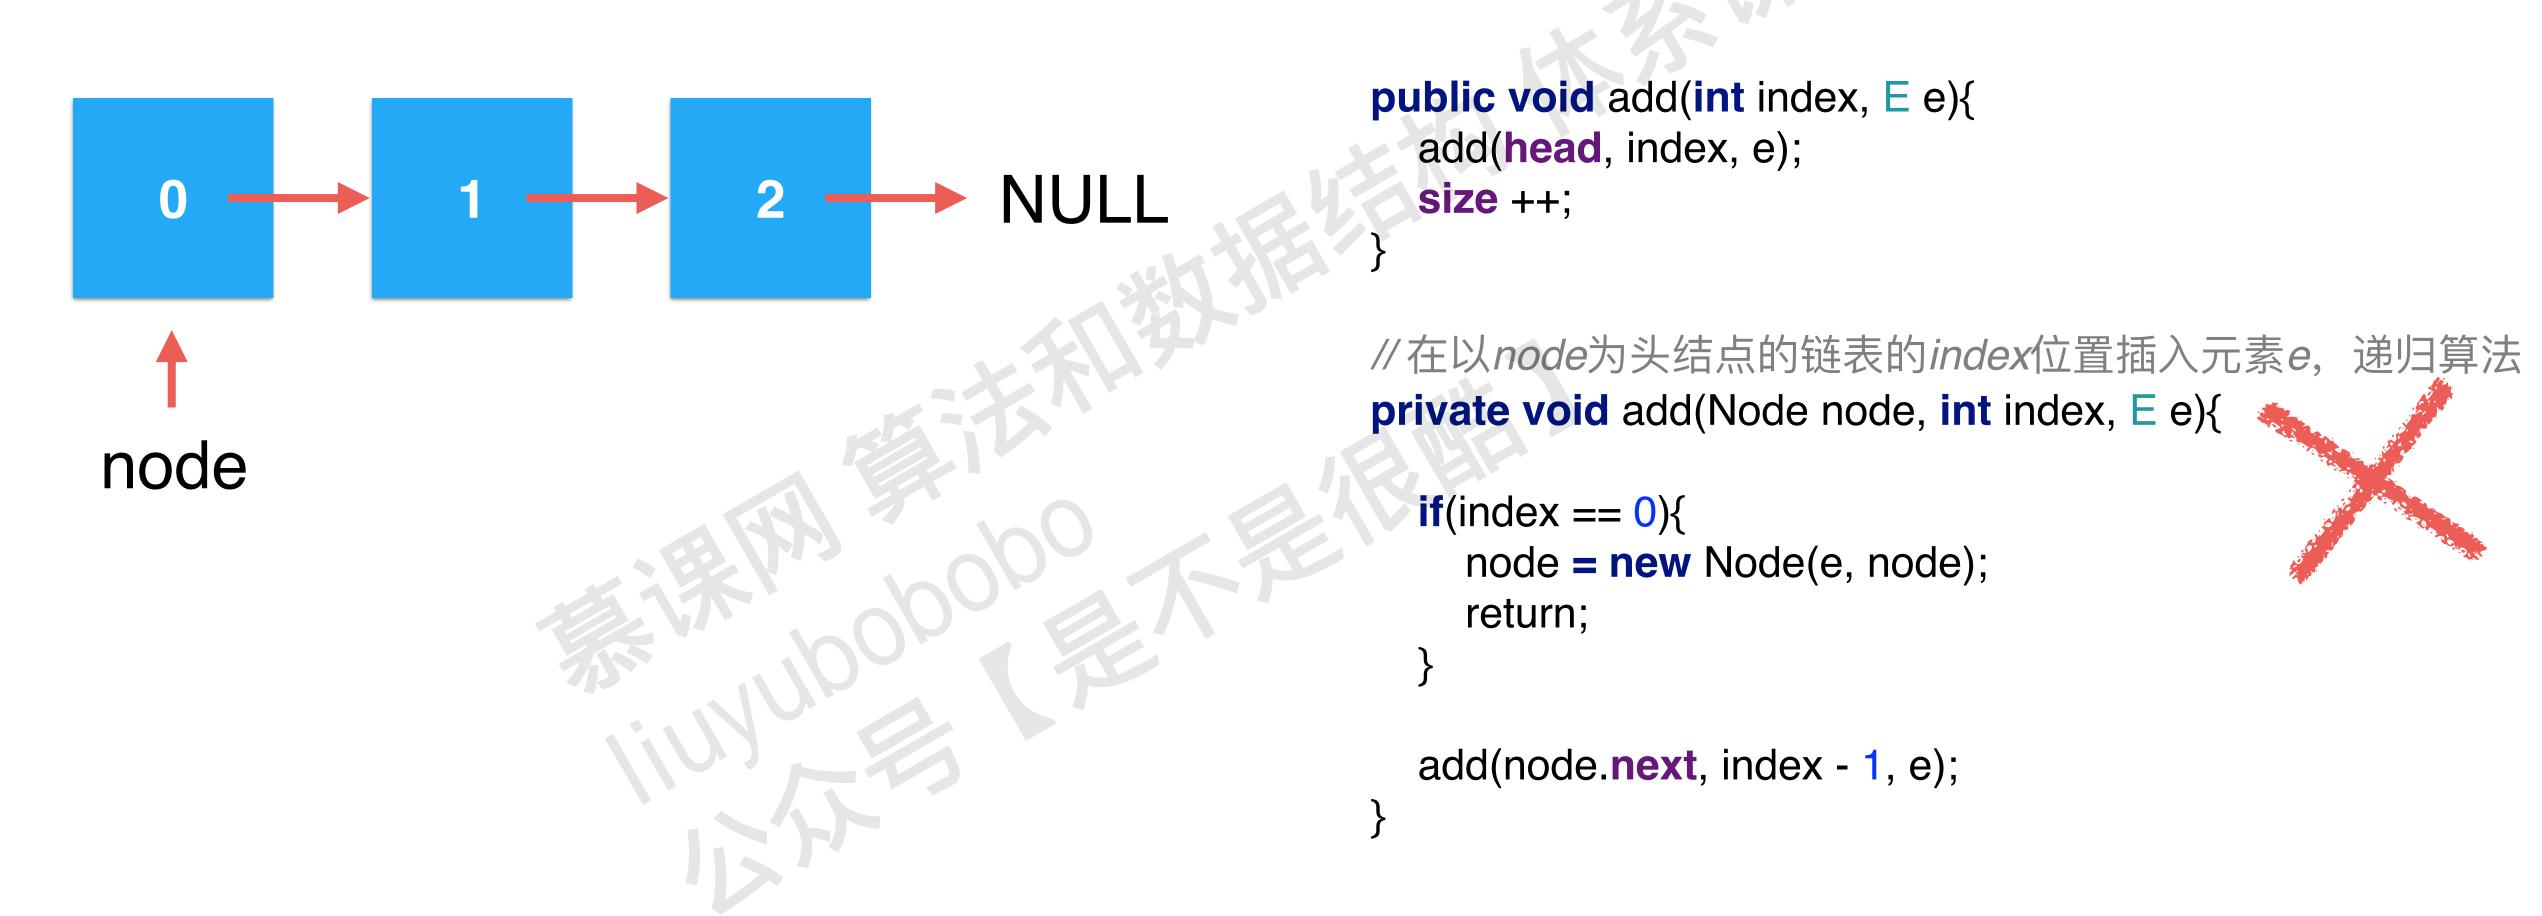

```
public void add(int index, E e){
  add(head, index, e);
  size ++;
//在以node为头结点的链表的index位置插入元素e,递归算法
private void add(Node node, int index, E e){
  if(index == 0){
    node = new Node(e, node);
    return;
  add(node.next, index - 1, e);
```

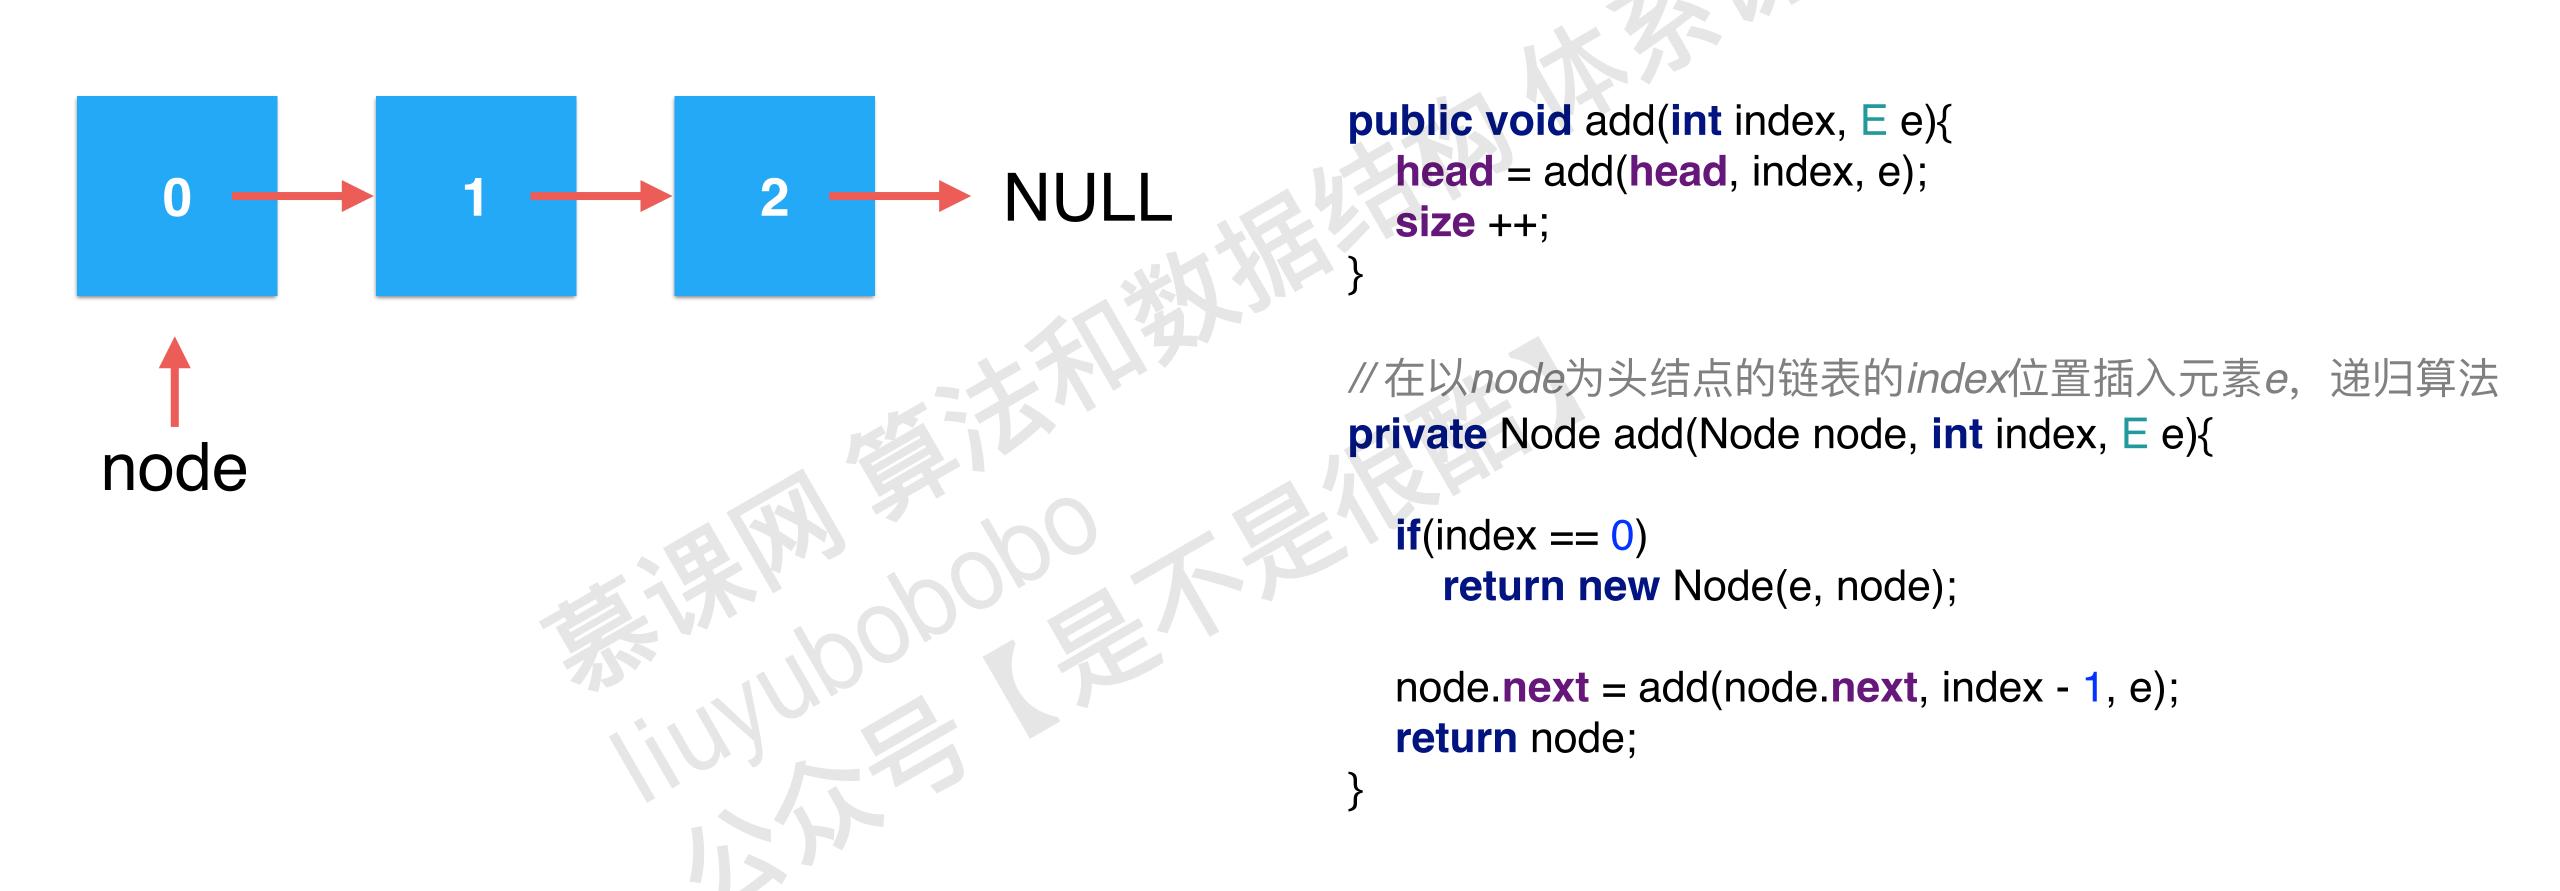

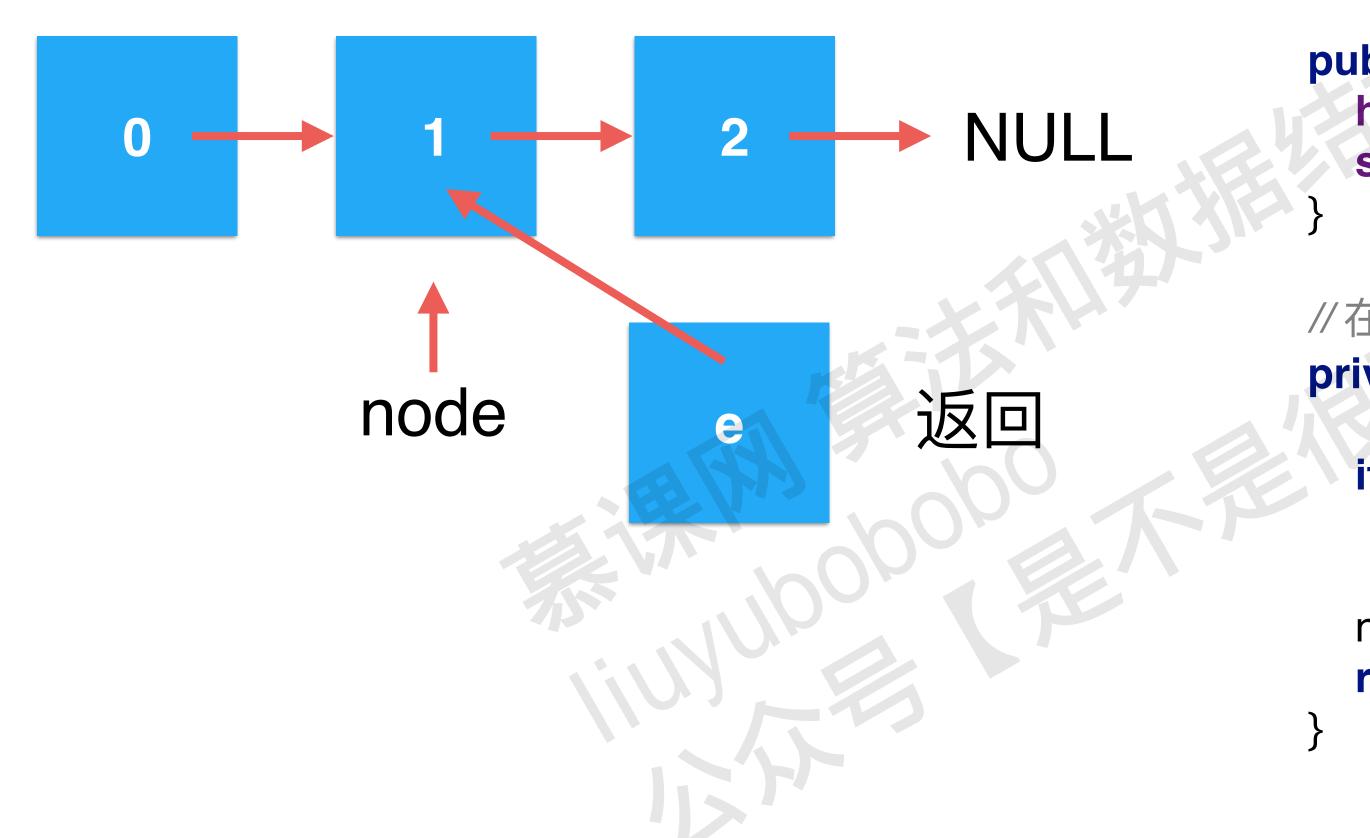

```
public void add(int index, E e){
  add(head, index, e);
  size ++;
//在以node为头结点的链表的index位置插入元素e,递归算法
private void add(Node node, int index, E e){
  if(index == 0){
    node = new Node(e, node);
    return;
  add(node.next, index - 1, e);
```

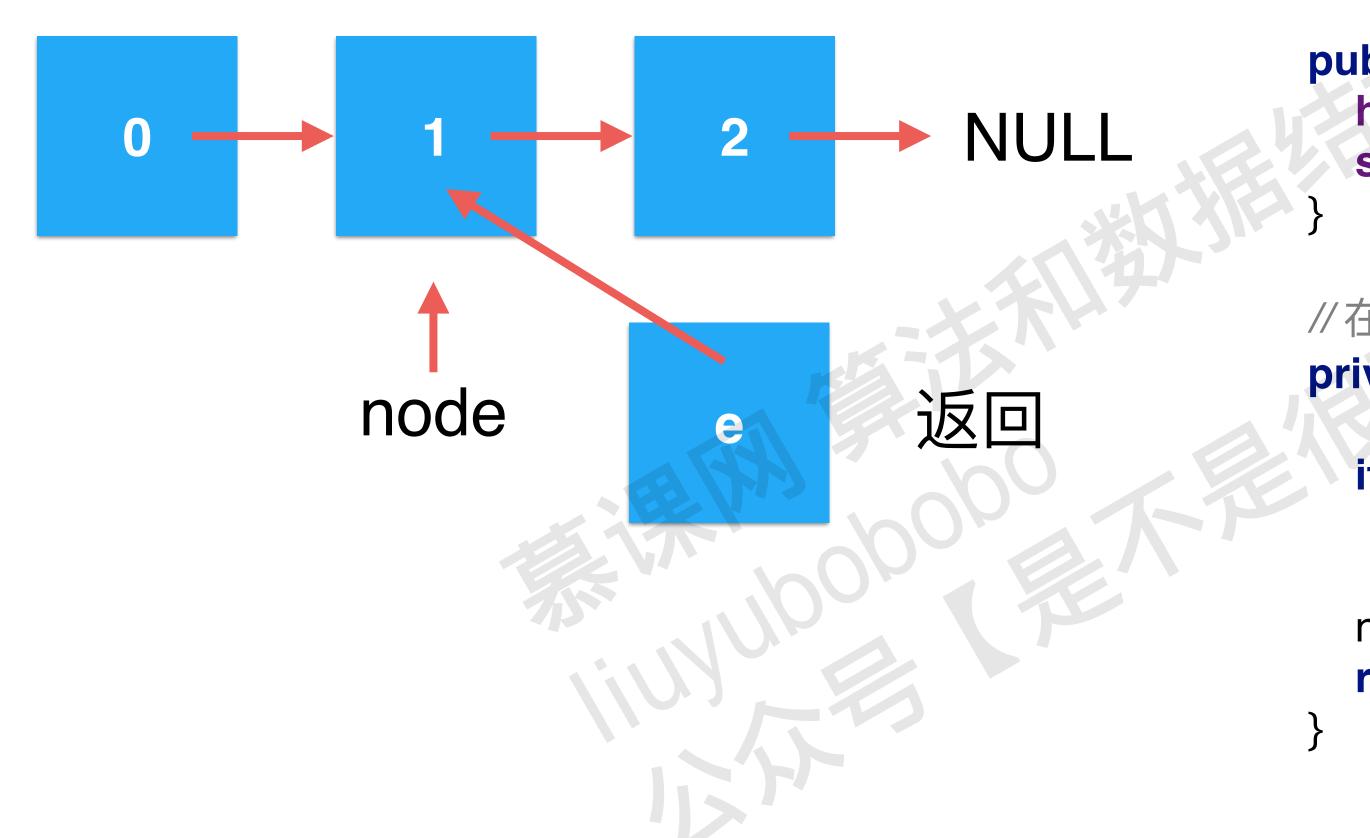

```
public void add(int index, E e){
  add(head, index, e);
  size ++;
//在以node为头结点的链表的index位置插入元素e,递归算法
private void add(Node node, int index, E e){
  if(index == 0){
    node = new Node(e, node);
    return;
  add(node.next, index - 1, e);
```

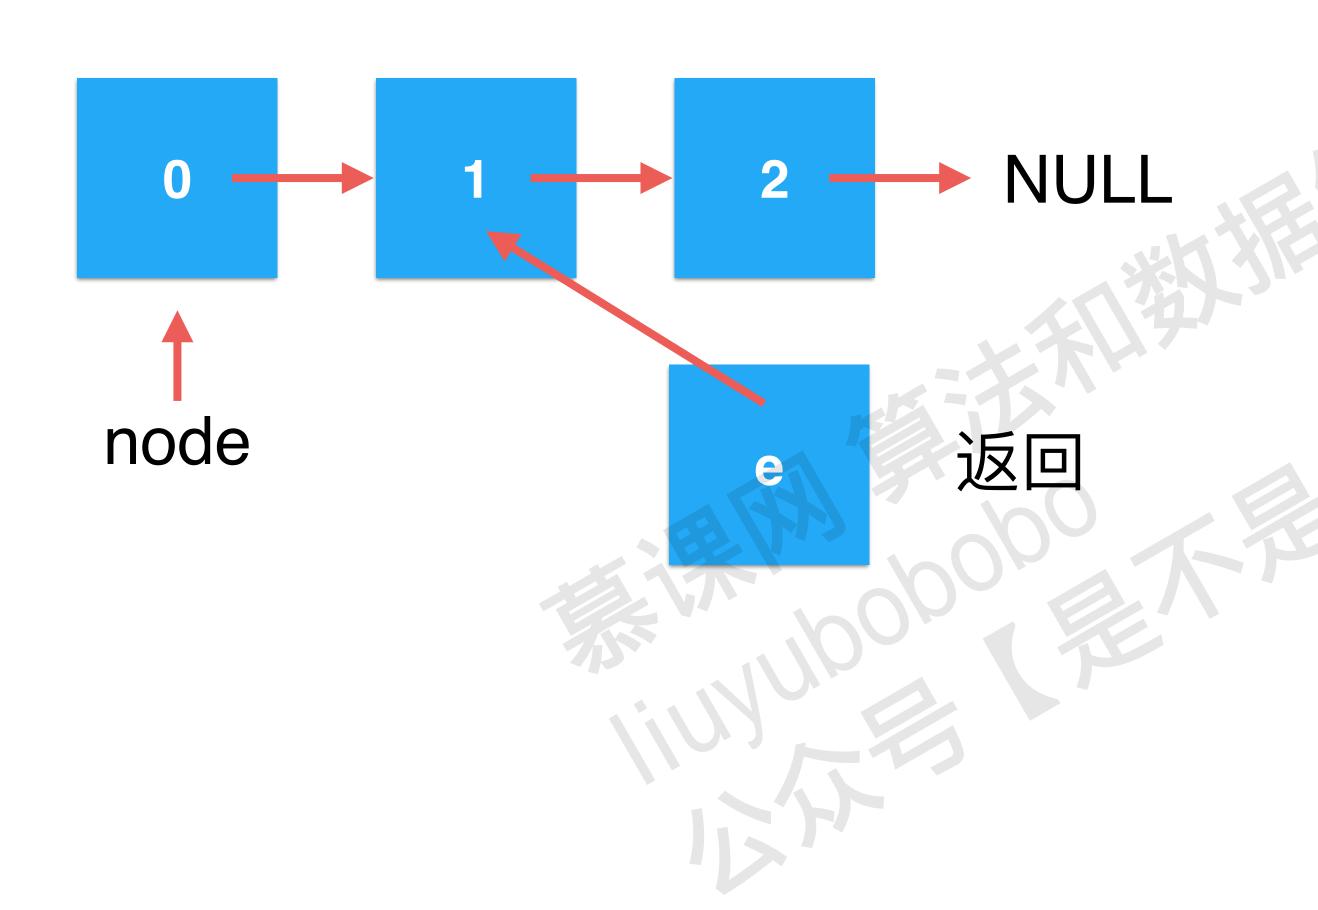

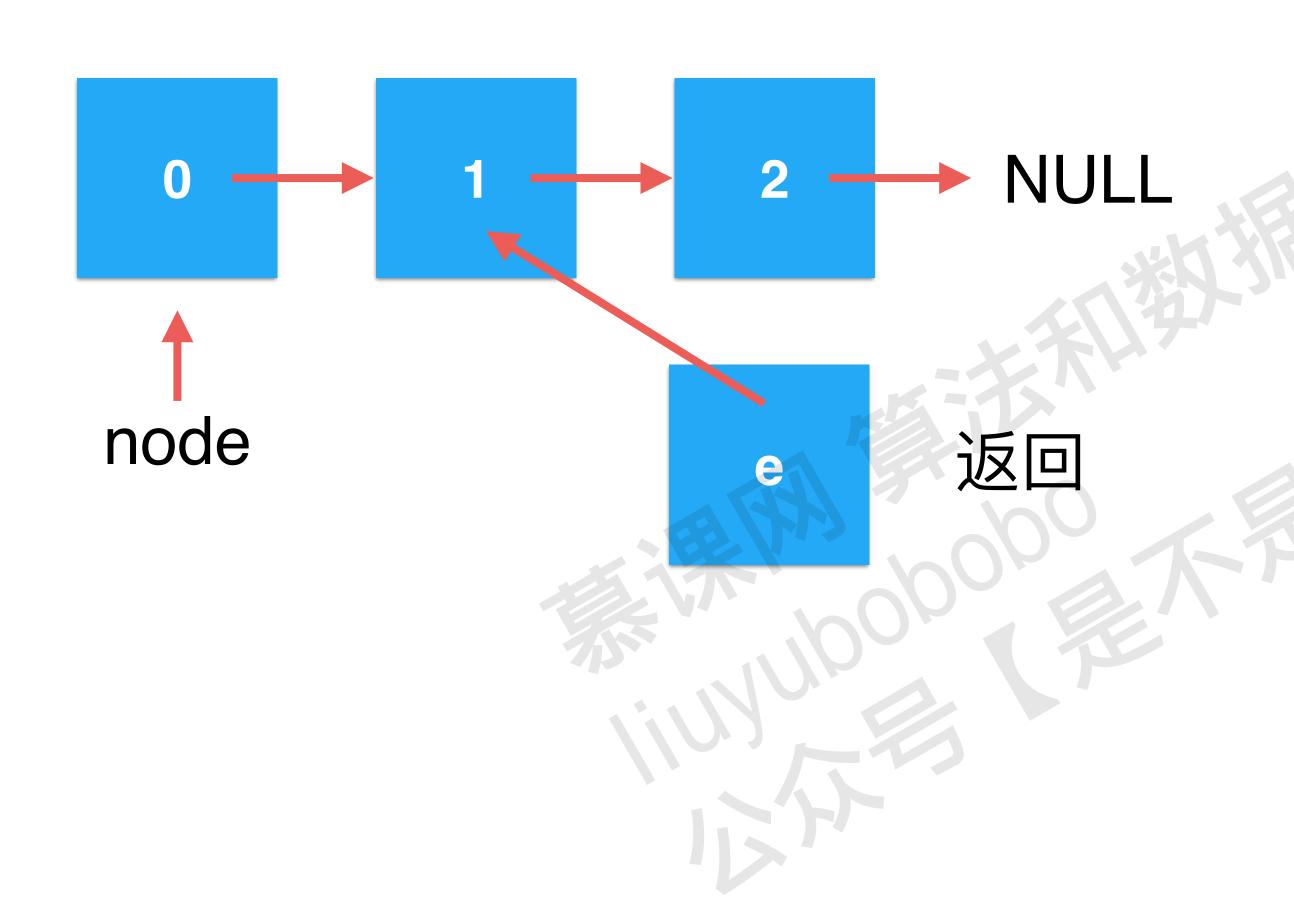

```
public void add(int index, E e){
  head = add(head, index, e);
  size ++;
//在以node为头结点的链表的index位置插入元素e,递归算法
private Node add(Node node, int index, E e){
  if(index == 0)
    return new Node(e, node);
  node.next = add(node.next, index - 1, e);
  return node;
```

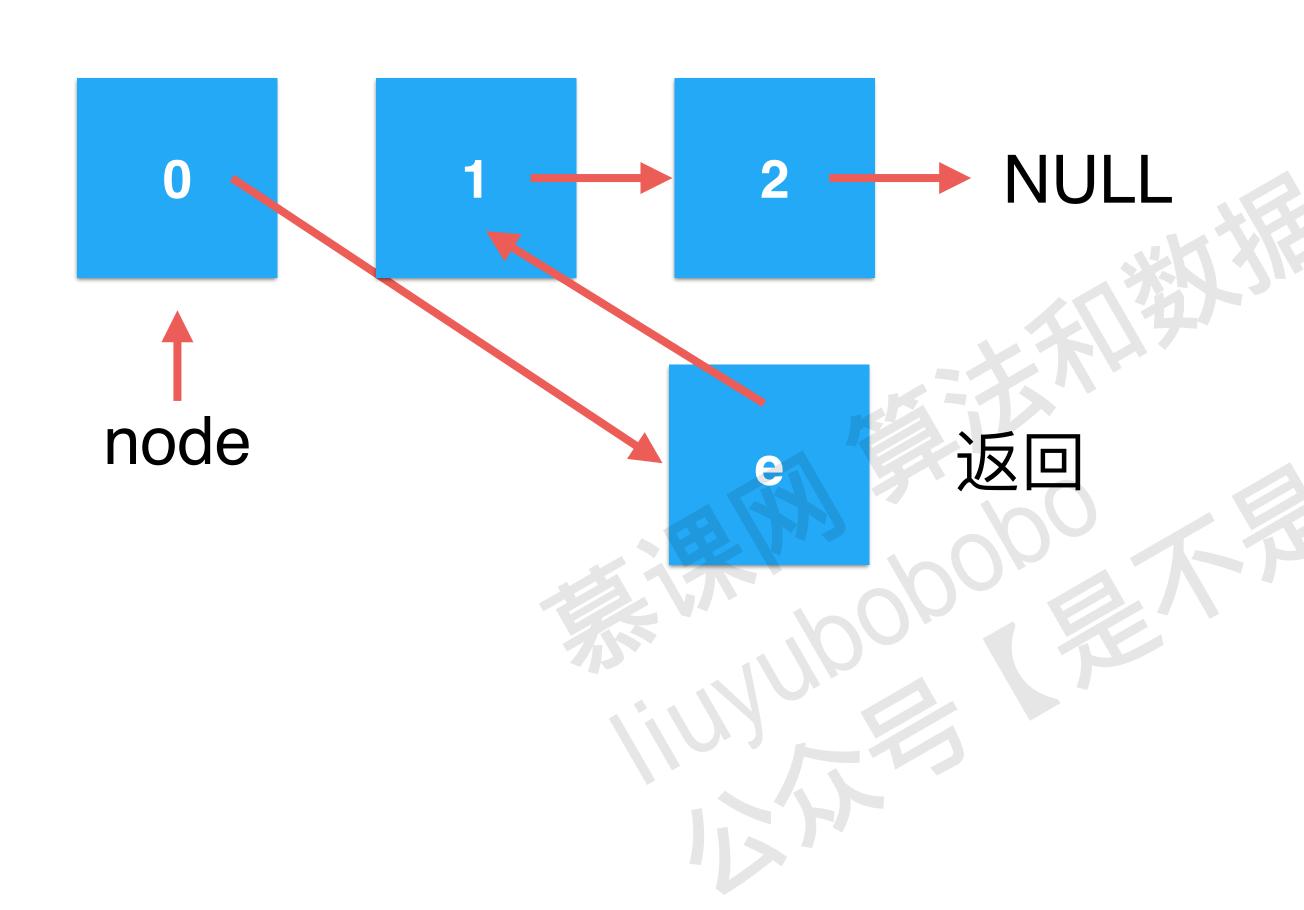

```
public void add(int index, E e){
  head = add(head, index, e);
  size ++;
//在以node为头结点的链表的index位置插入元素e,递归算法
private Node add(Node node, int index, E e){
  if(index == 0)
    return new Node(e, node);
  node.next = add(node.next, index - 1, e);
  return node;
```

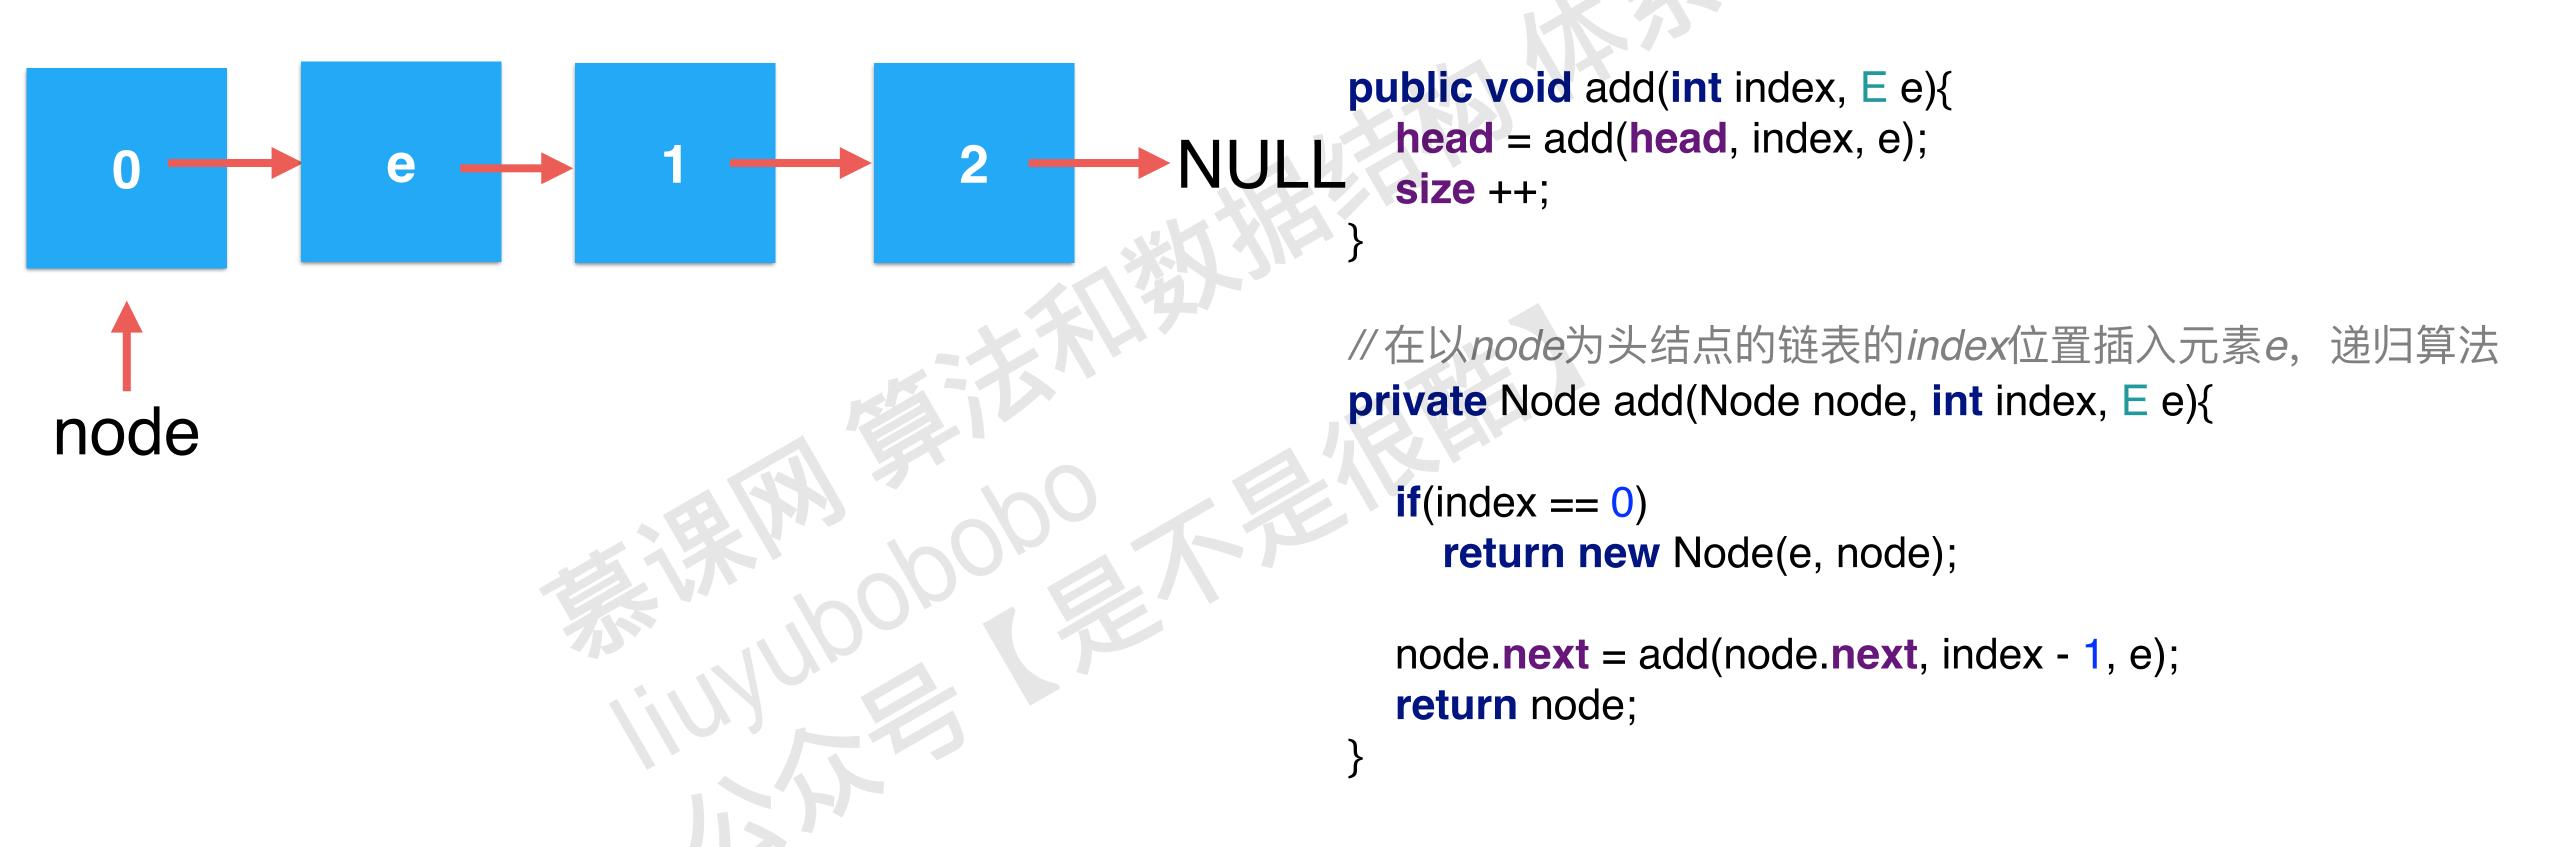

```
public void add(int index, E e){
  head = add(head, index, e);
  size ++;
//在以node为头结点的链表的index位置插入元素e,递归算法
private Node add(Node node, int index, E e){
  if(index == 0)
    return new Node(e, node);
  node.next = add(node.next, index - 1, e);
  return node;
```

```
public void add(int index, E e){
  head = add(head, index, e);
  size ++;
//在以node为头结点的链表的index位置插入元素e,递归算法
private Node add(Node node, int index, E e){
  if(index == 0)
    return new Node(e, node);
  node.next = add(node.next, index - 1, e);
  return node;
```

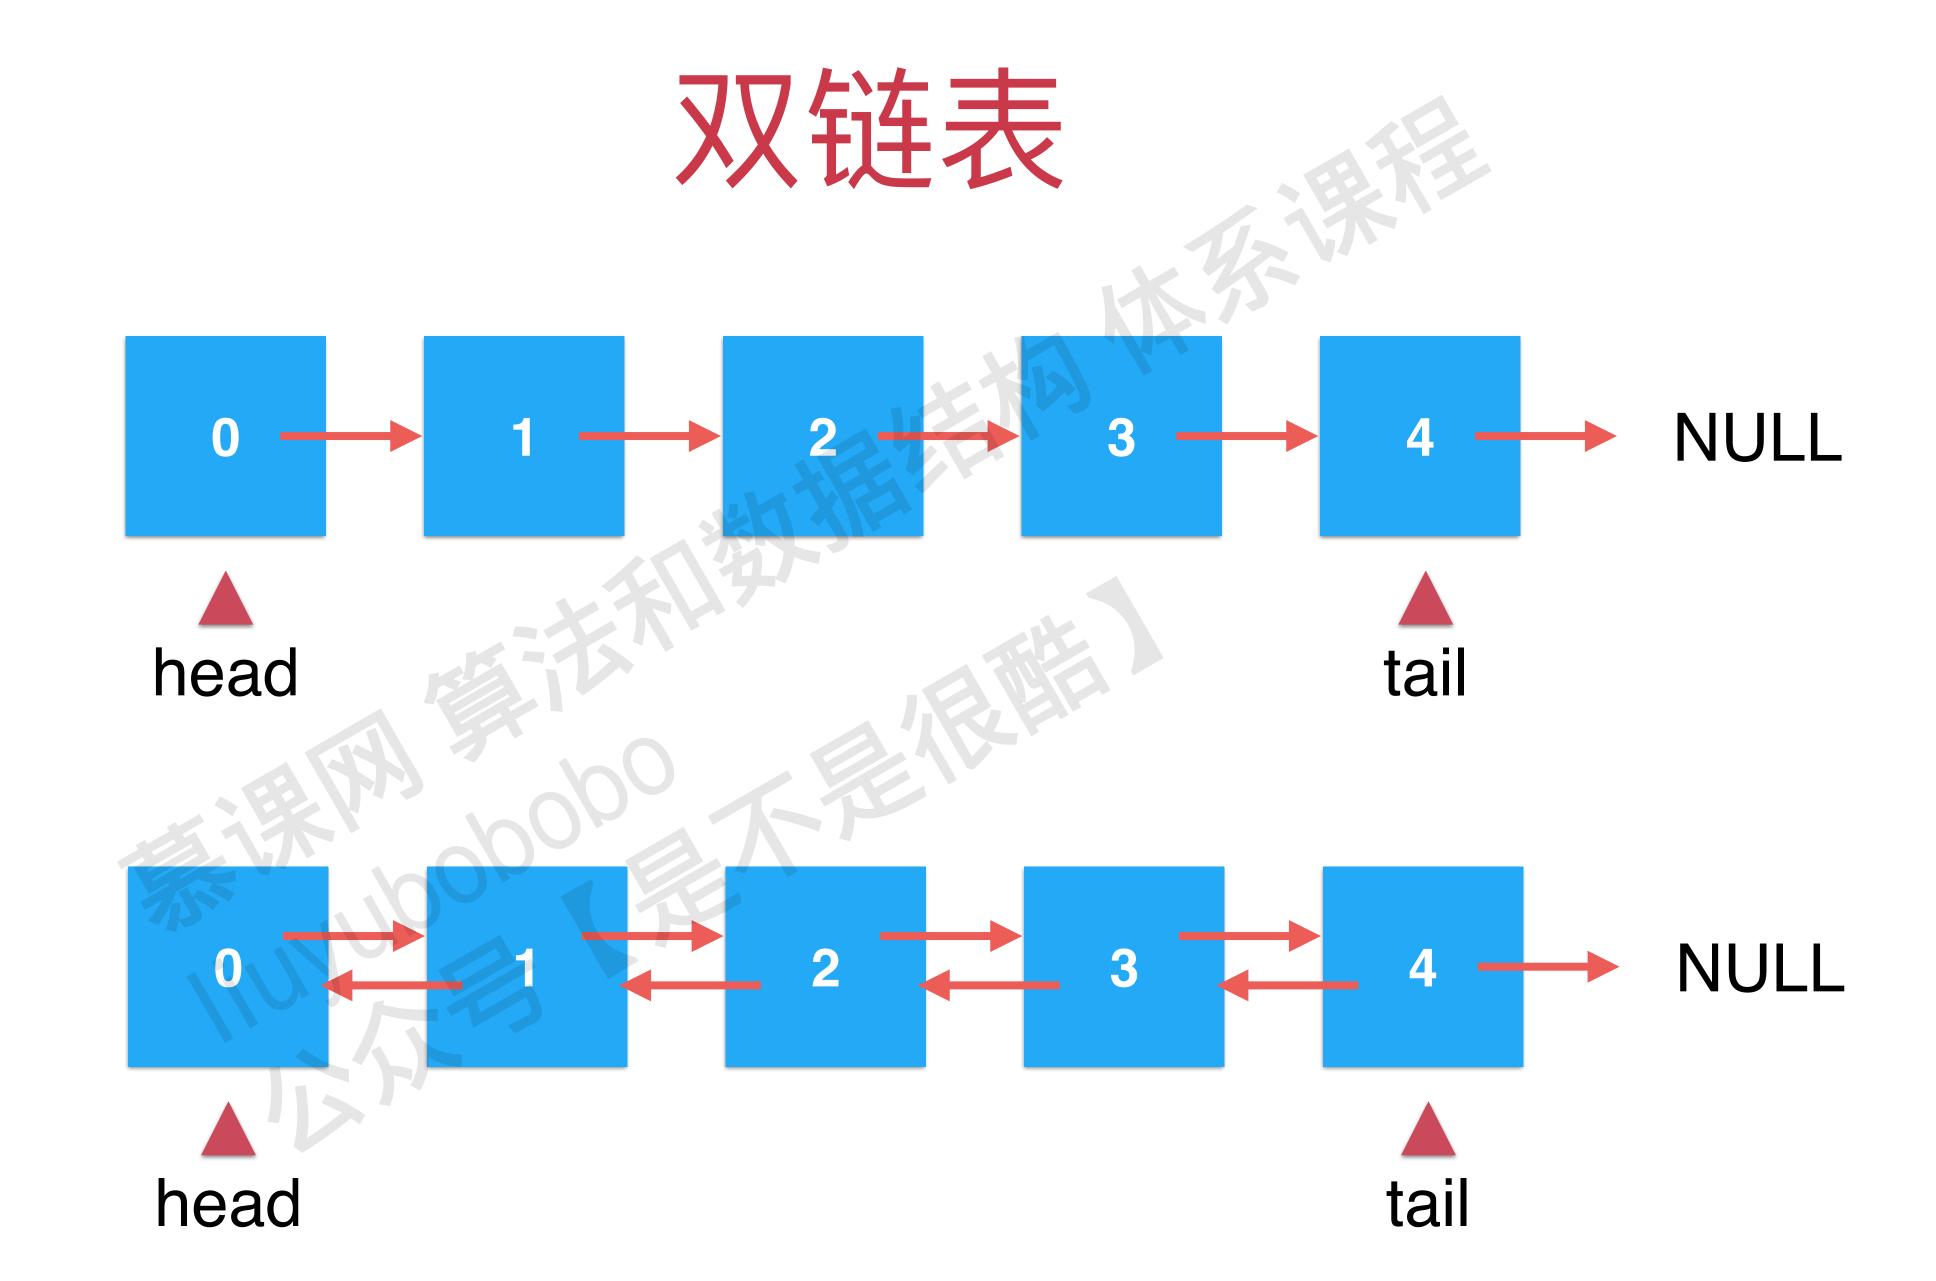

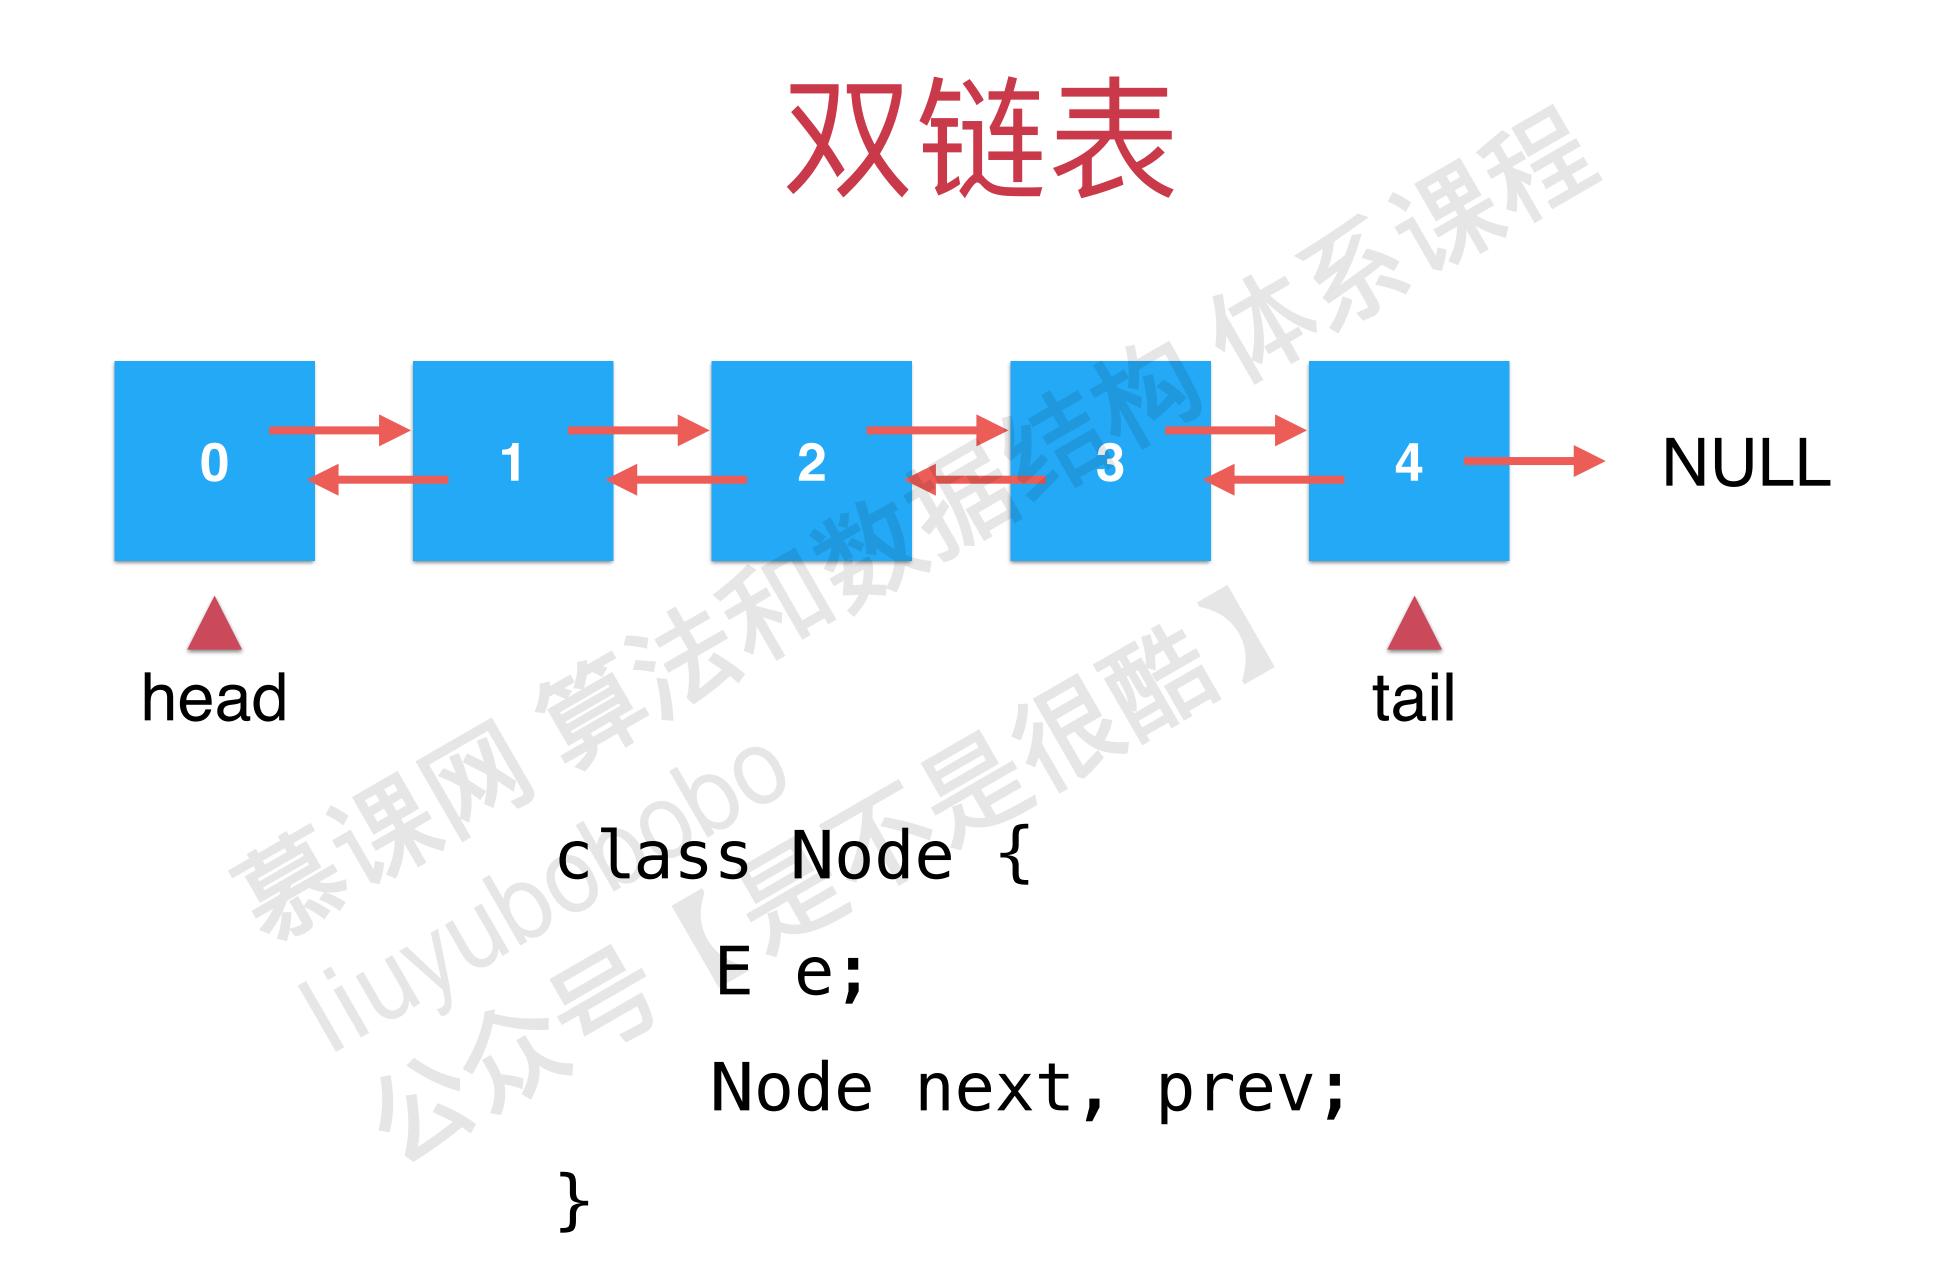

```
public void add(int index, E e){
  head = add(head, index, e);
  size ++;
//在以node为头结点的链表的index位置插入元素e,递归算法
private Node add(Node node, int index, E e){
  if(index == 0)
    return new Node(e, node);
  node.next = add(node.next, index - 1, e);
  return node;
```

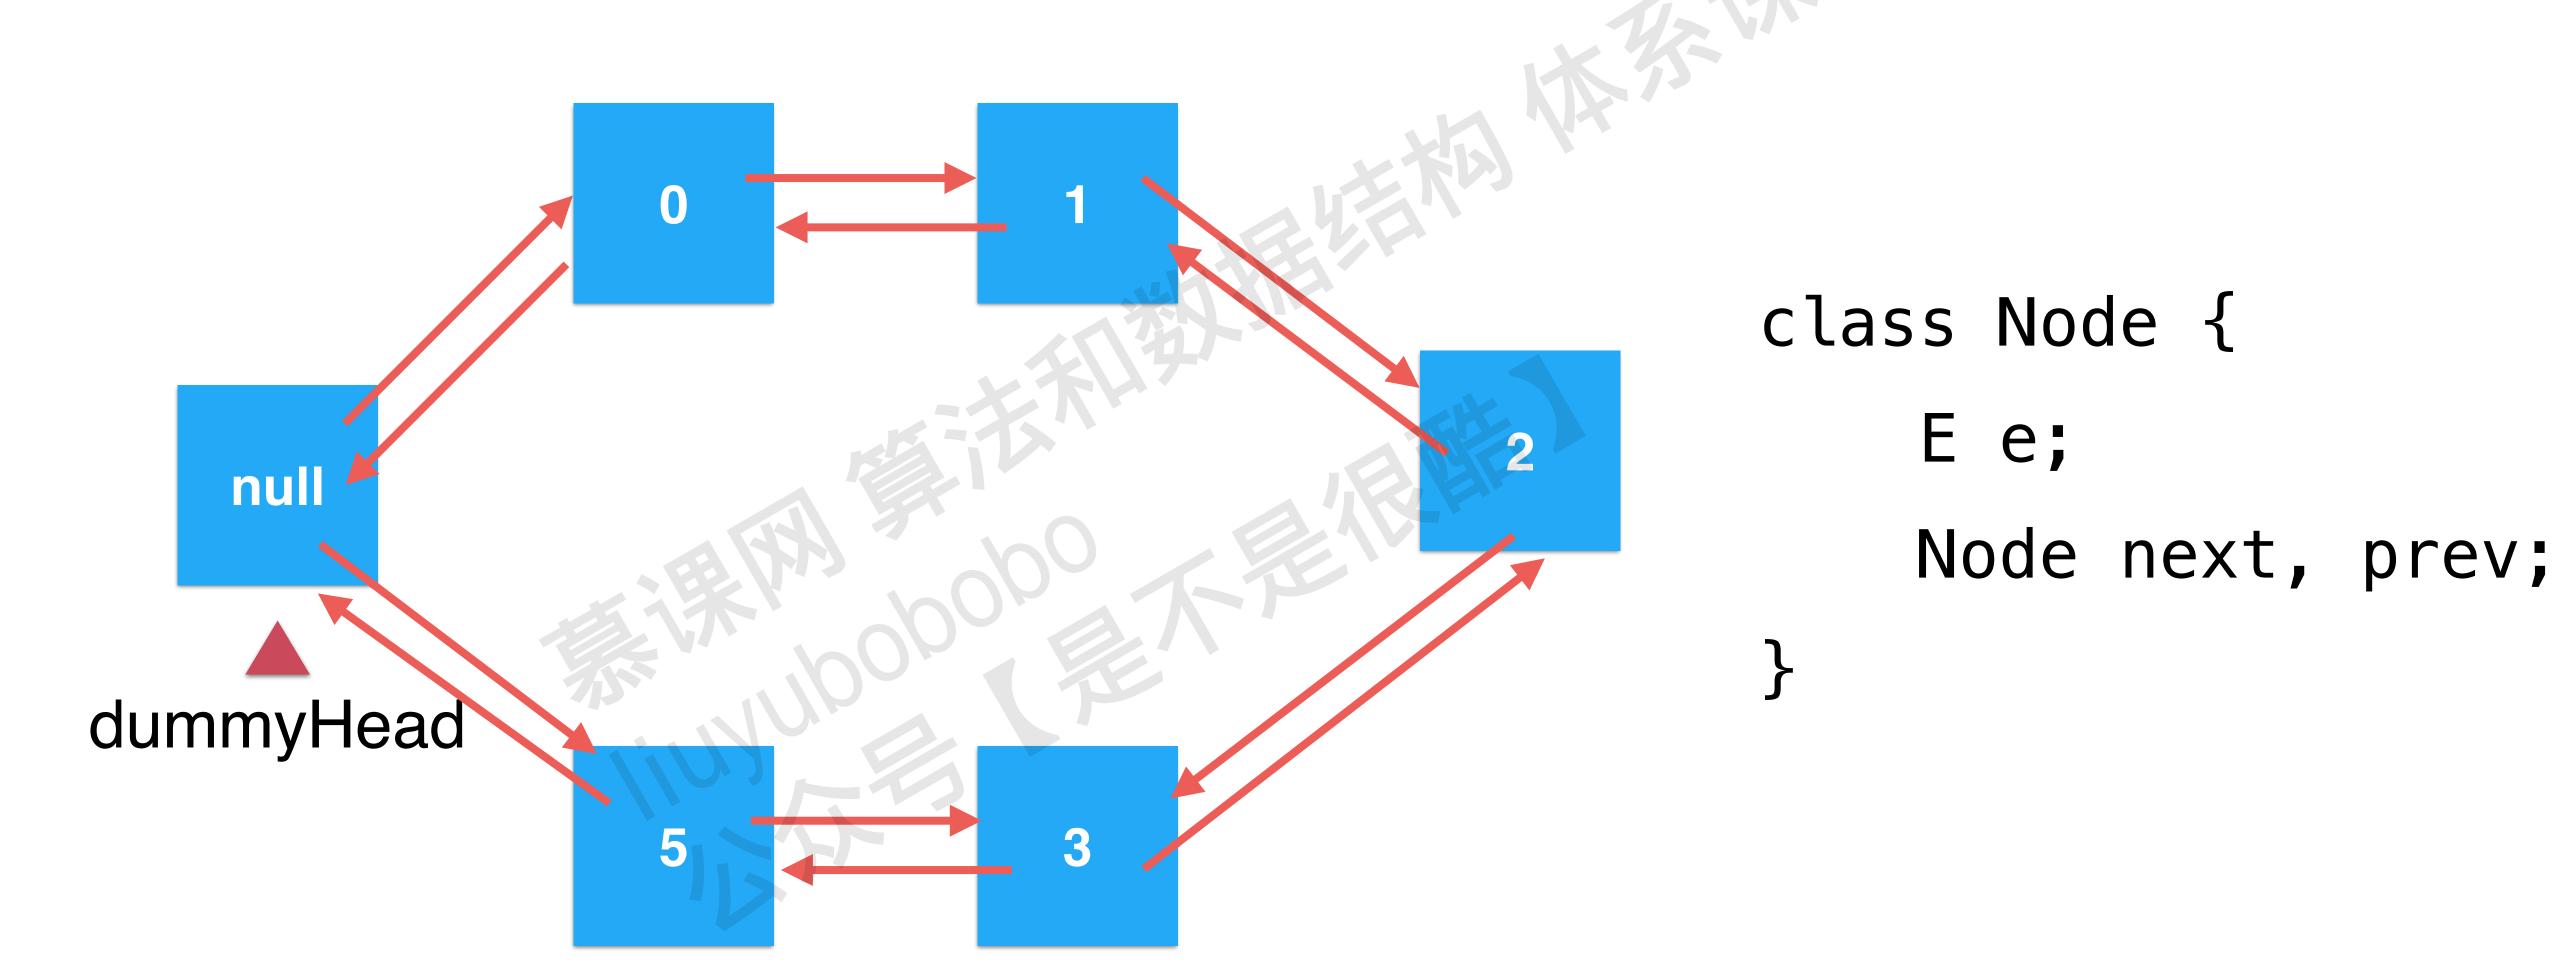

更多和链表相关的话题

斯坦福文档说明

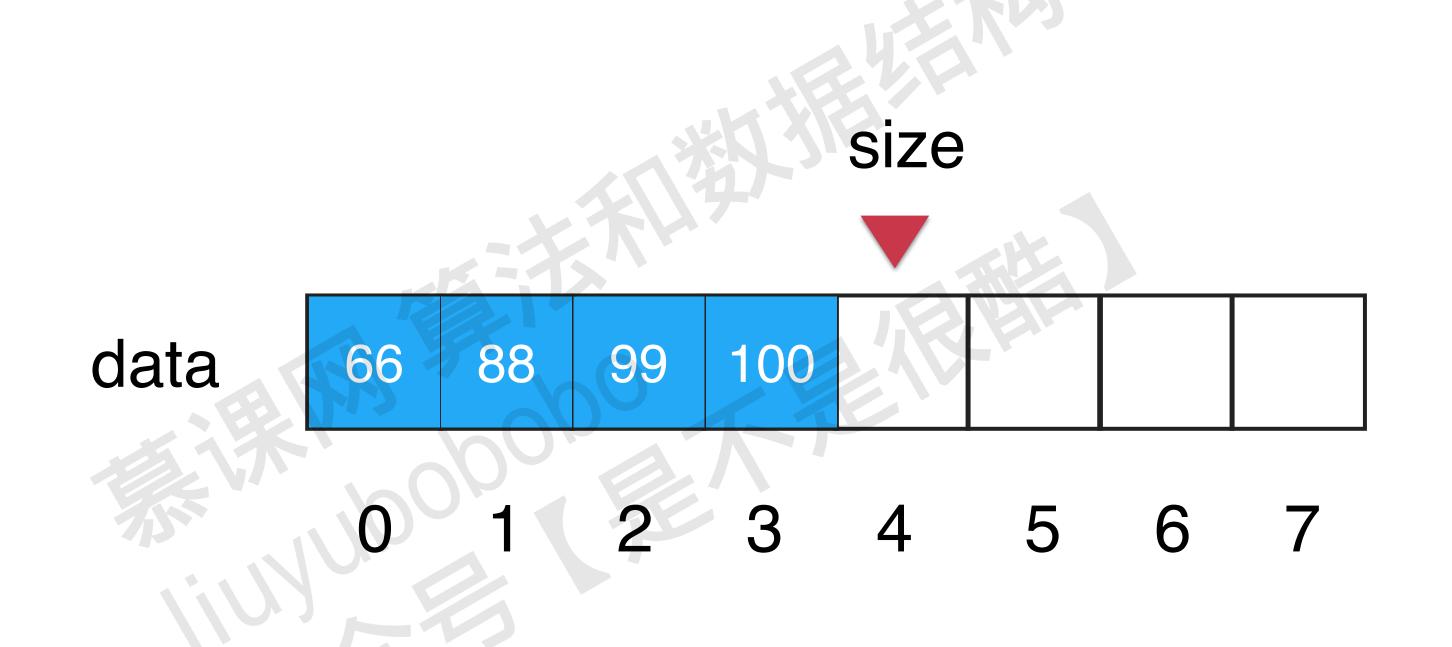

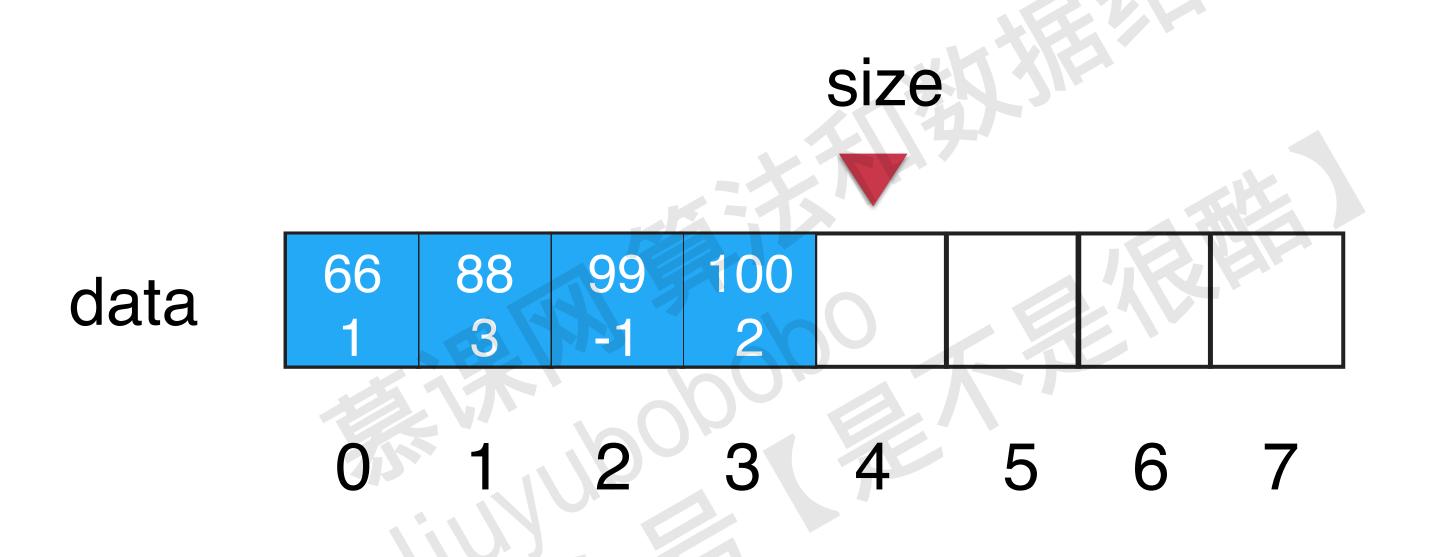

循环链表

数组链表

数组链表

```
class Node {
    E e;
    int next;
}
```

禁课^用链表 invitodoo
